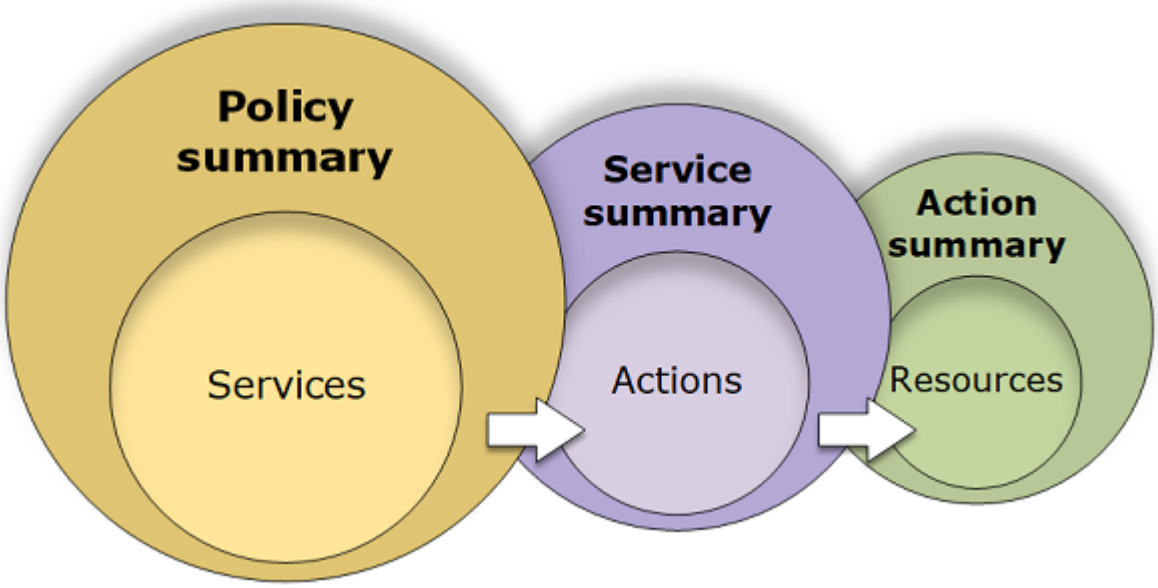
Policy summaries

The IAM console includes *policy summary* tables that describe the access level, resources, and conditions that are allowed or denied for each service in a policy. Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *policy summary* table includes a list of services. Choose a service there to see the *service summary*. This summary table includes a list of the actions and associated permissions for the chosen service. You can choose an action from that table to view the *action summary*. This table includes a list of resources and conditions for the chosen action.



You can view policy summaries on the **Users** page or **Roles** page for all policies (managed and inline) that are attached to that user. View summaries on the **Policies** page for all managed policies. Managed policies include AWS managed policies, AWS managed job function policies, and customer managed policies. You can view summaries for these policies on the **Policies** page regardless of whether they are attached to a user or other IAM identity.

You can use the information in the policy summaries to understand the permissions that are allowed or denied by your policy. Policy summaries can help you troubleshoot and fix policies that are not providing the permissions that you expect.

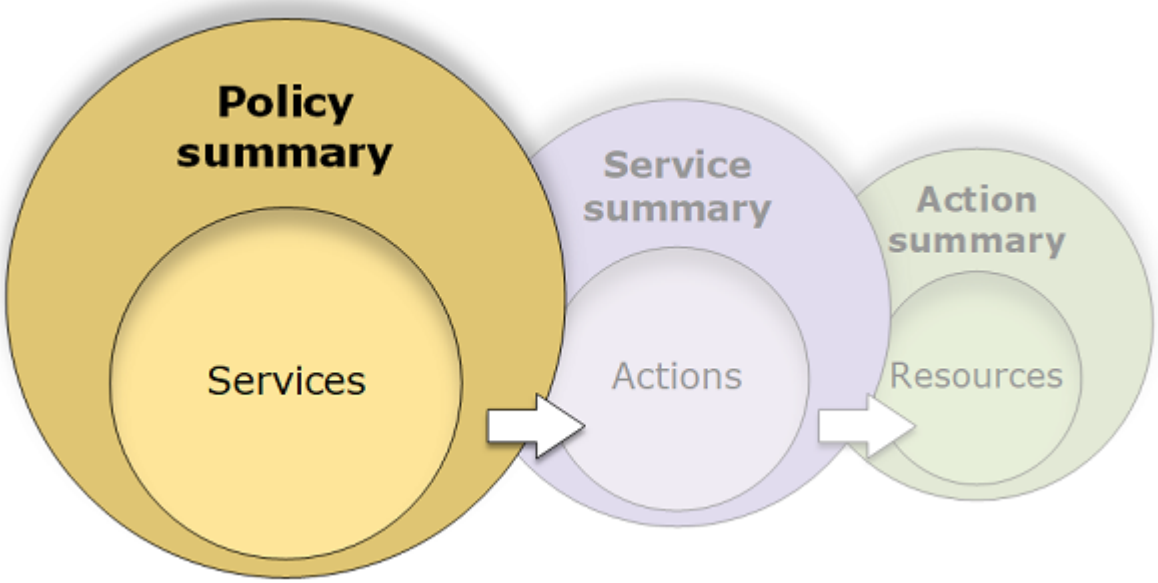
Topics

- Policy summary (list of services)
- Access levels in policy summaries
- Service summary (list of actions)

- Action summary (list of resources)
- Examples of policy summaries

Policy summary (list of services)

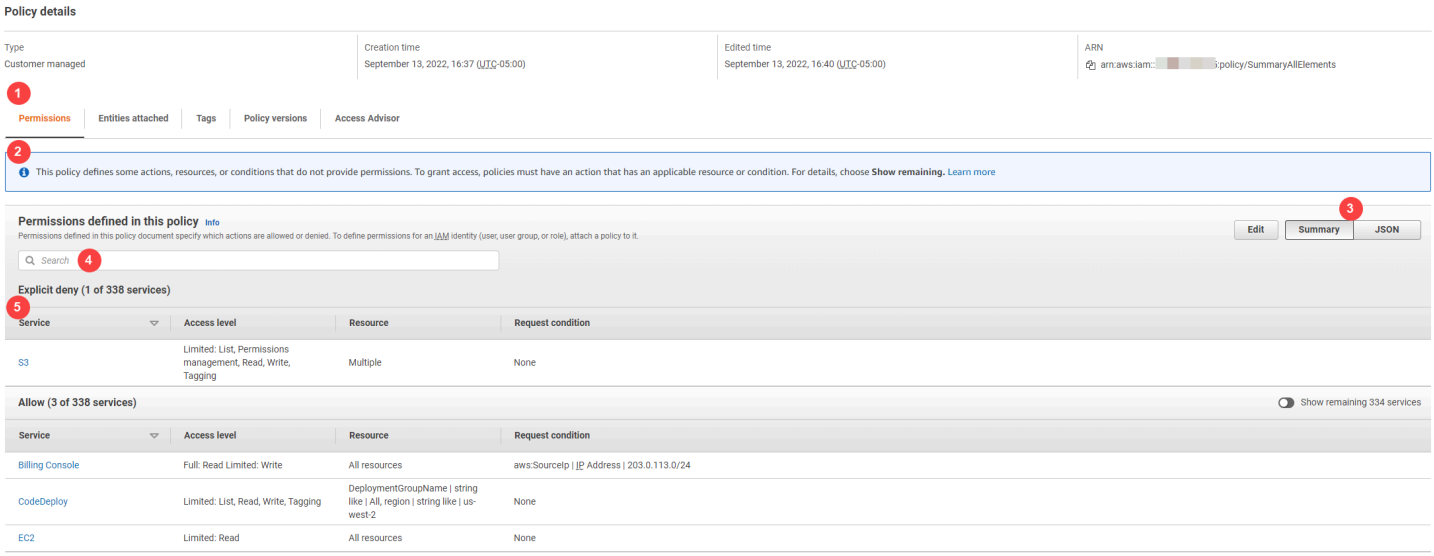
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *policy summary* table includes a list of services and summaries of the permissions that are defined by the chosen policy.



The policy summary table is grouped into one or more **Uncategorized services**, **Explicit deny**, and **Allow** sections. If the policy includes a service that IAM does not recognize, then the service is included in the **Uncategorized services** section of the table. If IAM recognizes the service, then it is included under the **Explicit deny** or **Allow** sections of the table, depending on the effect of the policy (`Deny` or `Allow`).

Understanding the elements of a policy summary

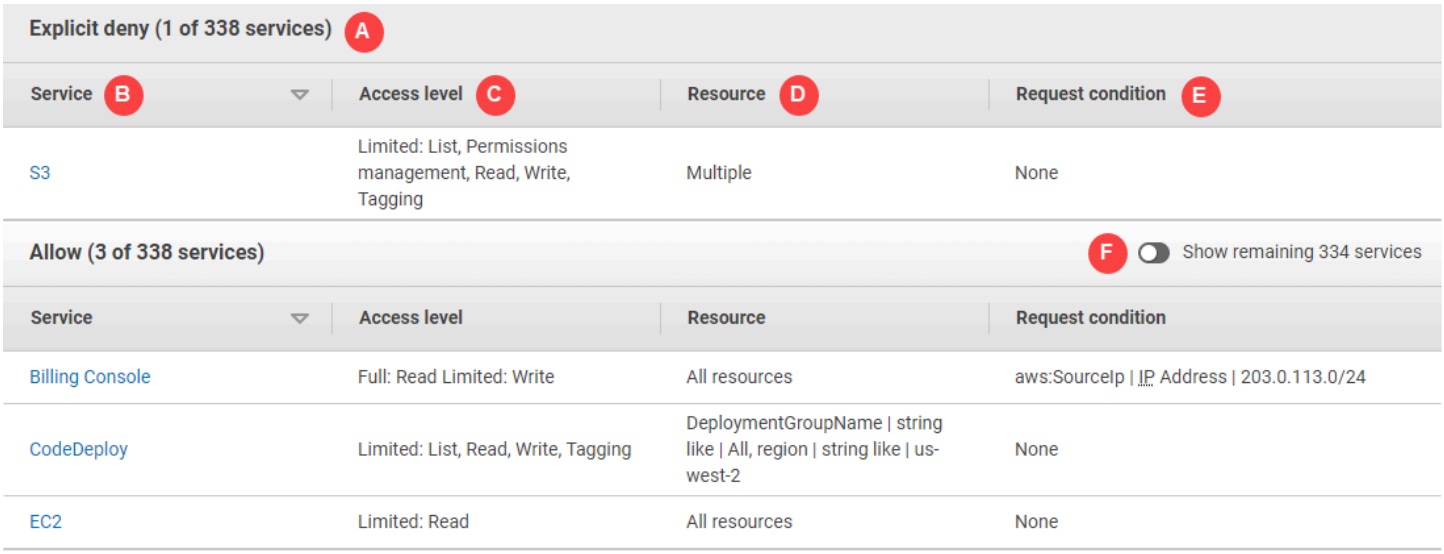
In the following example of a policy details page, the **SummaryAllElements** policy is a managed policy (customer managed policy) that is attached directly to the user. This policy is expanded to show the policy summary.



In the preceding image, the policy summary is visible from within the **Policies** page:

1. The **Permissions** tab includes the permissions defined in the policy.
2. If the policy does not grant permissions to all the actions, resources, and conditions defined in the policy, then a warning or error banner appears at the top of the page. The policy summary then includes details about the problem. To learn how policy summaries help you to understand and troubleshoot the permissions that your policy grants, see the section called “My policy does not grant the expected permissions”.
3. Use the **Summary** and **JSON** buttons to toggle between the policy summary and the JSON policy document.
4. Use the **Search** box to reduce the list of services and find a specific service.
5. The expanded view shows additional details of the **SummaryAllElements** policy.

The following policy summary table image shows the expanded **SummaryAllElements** policy on the policy details page.



Explicit deny (1 of 338 services) A

Service B	Access level C	Resource D	Request condition E
S3	Limited: List, Permissions management, Read, Write, Tagging	Multiple	None

Allow (3 of 338 services) F Show remaining 334 services

Service	Access level	Resource	Request condition
Billing Console	Full: Read Limited: Write	All resources	aws:SourceIp | IP Address | 203.0.113.0/24
CodeDeploy	Limited: List, Read, Write, Tagging	DeploymentGroupName | string like | All, region | string like | us-west-2	None
EC2	Limited: Read	All resources	None

In the preceding image, the policy summary is visible from within the **Policies** page:

A. For those services that IAM recognizes, it arranges services according to whether the policy allows or explicitly denies the use of the service. In this example, the policy includes a `Deny` statement for the Amazon S3 service and `Allow` statements for the Billing, CodeDeploy, and Amazon EC2 services.

B. **Service** – This column lists the services that are defined within the policy and provides details for each service. Each service name in the policy summary table is a link to the *service summary* table, which is explained in Service summary (list of actions). In this example, permissions are defined for the Amazon S3, Billing, CodeDeploy, and Amazon EC2 services.

C. **Access level** – This column tells whether the actions in each access level (`List`, `Read`, `Write`, `Permission Management`, and `Tagging`) have `Full` or `Limited` permissions defined in the policy. For additional details and examples of the access level summary, see Access levels in policy summaries.

- **Full access** – This entry indicates that the service has access to all actions within all four of the access levels available for the service.
- If the entry does not include **Full access**, then the service has access to some but not all of the actions for the service. The access is then defined by following descriptions for each of the access level classifications (`List`, `Read`, `Write`, `Permission Management`, and `Tagging`):

  Full: The policy provides access to all actions within each access level classification listed. In this example, the policy provides access to all of the Billing `Read` actions.

Limited: The policy provides access to one or more but not all actions within each access level classification listed. In this example, the policy provides access to some of the Billing `Write` actions.

D. **Resource** – This column shows the resources that the policy specifies for each service.

- **Multiple** – The policy includes more than one but not all of the resources within the service. In this example, access is explicitly denied to more than one Amazon S3 resource.
- **All resources** – The policy is defined for all resources within the service. In this example, the policy allows the listed actions to be performed on all Billing resources.
- Resource text – The policy includes one resource within the service. In this example, the listed actions are allowed on only the `DeploymentGroupName` CodeDeploy resource. Depending on the information that the service provides to IAM, you might see an ARN or you might see the defined resource type.

> **Note**
>
> This column can include a resource from a different service. If the policy statement that includes the resource does not include both actions and resources from the same service, then your policy includes mismatched resources. IAM does not warn you about mismatched resources when you create a policy, or when you view a policy in the policy summary. If this column includes a mismatched resource, then you should review your policy for errors. To better understand your policies, always test them with the policy simulator.

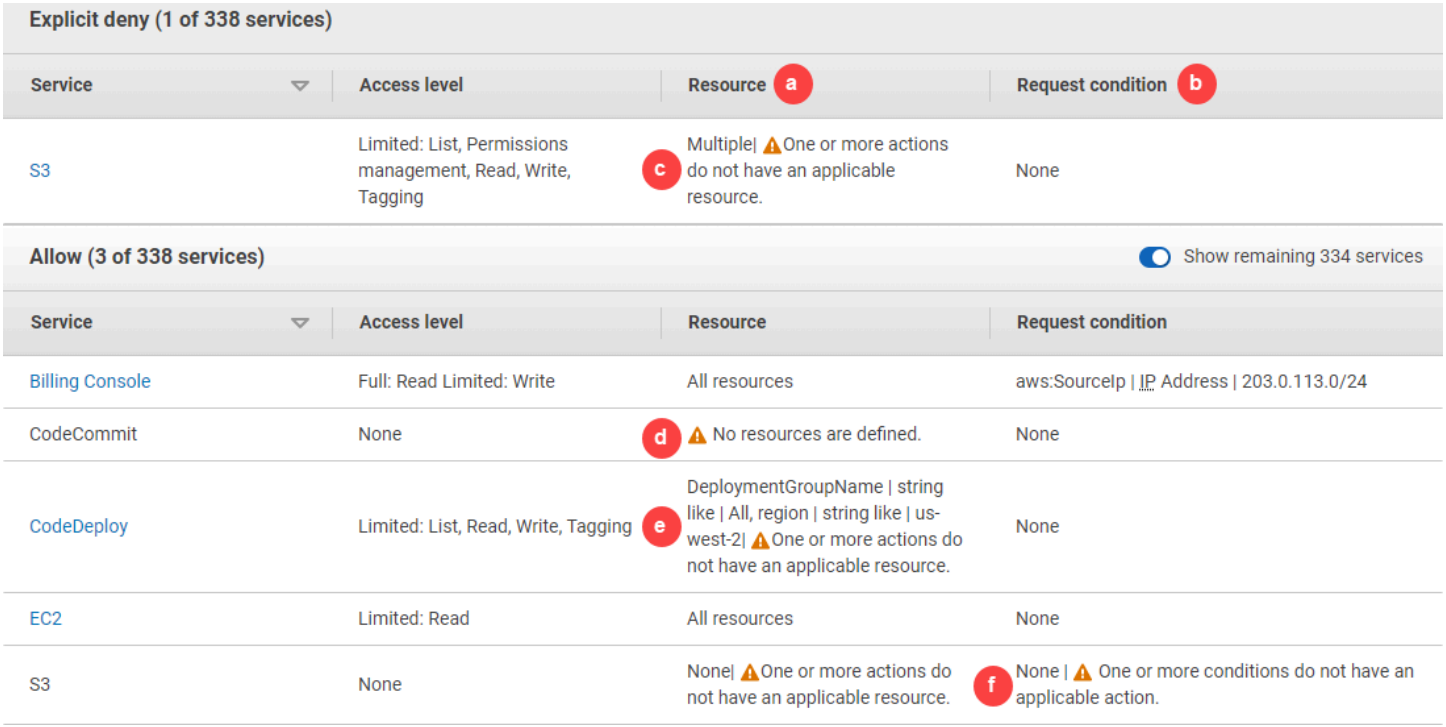
E. **Request condition** – This column indicates whether the services or actions associated with the resource are subject to conditions.

- **None** – The policy includes no conditions for the service. In this example no conditions are applied to the denied actions in the Amazon S3 service.
- Condition text – The policy includes one condition for the service. In this example, the listed Billing actions are allowed only if the IP address of the source matches `203.0.113.0/24`.
- **Multiple** – The policy includes more than one condition for the service. To view each of the multiple conditions for the policy, choose **JSON** to view the policy document.

F. **Show remaining services** – Toggle this button to expand the table to include the services that are not defined by the policy. These services are *implicitly denied* (or denied by default) within this policy. However, a statement in another policy might still allow or explicitly deny using the service. The policy summary summarizes the permissions of a single policy. To learn about

how the AWS service decides whether a given request should be allowed or denied, see Policy evaluation logic.

When a policy or an element within the policy does not grant permissions, IAM provides additional warnings and information in the policy summary. The following policy summary table shows the expanded **Show remaining services** services on the **SummaryAllElements** policy details page with the possible warnings.



Explicit deny (1 of 338 services)

Service	Access level	Resource a	Request condition b
S3	Limited: List, Permissions management, Read, Write, Tagging	c Multiple| ⚠ One or more actions do not have an applicable resource.	None

Allow (3 of 338 services) Show remaining 334 services

Service	Access level	Resource	Request condition
Billing Console	Full: Read Limited: Write	All resources	aws:SourceIp | IP Address | 203.0.113.0/24
CodeCommit	None	d ⚠ No resources are defined.	None
CodeDeploy	Limited: List, Read, Write, Tagging	e DeploymentGroupName | string like | All, region | string like | us-west-2| ⚠ One or more actions do not have an applicable resource.	None
EC2	Limited: Read	All resources	None
S3	None	None| ⚠ One or more actions do not have an applicable resource.	f None | ⚠ One or more conditions do not have an applicable action.

In the preceding image, you can see all services that include defined actions, resources, or conditions with no permissions:

a. **Resource warnings** – For services that do not provide permissions for all of the included actions or resources, you see one of the following warnings in the **Resource** column of the table:

- ⚠

  No resources are defined. – This means that the service has defined actions but no supported resources are included in the policy.

- ⚠

  One or more actions do not have an applicable resource. – This means that the service has defined actions, but that some of those actions don't have a supported resource.

-

  One or more resources do not have an applicable action. – This means that the service has defined resources, but that some of those resources don't have a supporting action.

  If a service includes both actions that do not have an applicable resource and resources that do have an applicable resource, then only the **One or more resources do not have an applicable action.** warning is shown. This is because when you view the service summary for the service, resources that do not apply to any action are not shown. For the `ListAllMyBuckets` action, this policy includes the last warning because the action does not support resource-level permissions, and does not support the `s3:x-amz-acl` condition key. If you fix either the resource problem or the condition problem, the remaining issue appears in a detailed warning.

b. **Request condition warnings** – For services that do not provide permissions for all of the included conditions, you see one of the following warnings in the **Request condition** column of the table:

   -

     One or more actions do not have an applicable condition. – This means that the service has defined actions, but that some of those actions don't have a supported condition.

   -

     One or more conditions do not have an applicable action. – This means that the service has defined conditions, but that some of those conditions don't have a supporting action.

c. **Multiple |**

   One or more actions do not have an applicable resource. – The `Deny` statement for Amazon S3 includes more than one resource. It also includes more than one action, and some actions support the resources and some do not. To view this policy, see the section called "**SummaryAllElements** JSON policy document". In this case, the policy includes all Amazon S3 actions, and only the actions that can be performed on a bucket or bucket object are denied.

d.

   No resources are defined – The service has defined actions, but no supported resources are included in the policy, and therefore the service provides no permissions. In this case, the policy includes CodeCommit actions but no CodeCommit resources.

e. **DeploymentGroupName | string like | All, region | string like | us-west-2 |**

One or more actions do not have an applicable resource. – The service has a defined action, and at least one more action that does not have a supporting resource.

f. **None |**

One or more conditions do not have an applicable action. – The service has at least one condition key that does not have a supporting action.

SummaryAllElements JSON policy document

The **SummaryAllElements** policy is not intended for you to use to define permissions in your account. Rather, it is included to demonstrate the errors and warnings that you might encounter while viewing a policy summary.

}
```

View policy summaries

You can view the policy summaries for any policies that are attached to an IAM user or role. For managed policies, you can view policy summaries on the **Policies** page. If your policy does not include a policy summary, see Missing policy summary to learn why.

Viewing policy summaries from the Policies page

You can view the policy summary for managed policies on the **Policies** page.

To view the policy summary from the Policies page

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.

Viewing a policy summary for a policy attached to a user

You can view the policy summary for any policies that are attached to an IAM user.

To view the summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.

2. Choose **Users** from the navigation pane.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, expand the row of the policy that you want to view.

Viewing a policy summary for a policy attached to a role

You can view the policy summary for any policies that are attached to a role.

To view the summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, expand the row of the policy that you want to view.

Editing policies to fix warnings

While viewing a policy summary, you might find a typo or notice that the policy does not provide the permissions that you expected. You cannot edit a policy summary directly. However, you can edit a customer managed policy using the visual policy editor, which catches many of the same errors and warnings that the policy summary reports. You can then view the changes in the policy summary to confirm that you fixed all of the issues. To learn how to edit an inline policy, see the section called “Edit IAM policies”. You cannot edit AWS managed policies.

You can edit a policy for your policy summary using the **Visual** option.

To edit a policy for your policy summary using the Visual option

1. Open the policy summary as explained in the previous procedures.
2. Choose **Edit**.

If you are on the **Users** page and choose to edit a customer managed policy that is attached to that user, you are redirected to the **Policies** page. You can edit customer managed policies only on the **Policies** page.

3. Choose the **Visual** option to view the editable visual representation of your policy. IAM might restructure your policy to optimize it for the visual editor and to make it easier for you to find and fix any problems. The warnings and error messages on the page can guide you to fix any issues with your policy. For more information about how IAM restructures policies, see Policy restructuring.
4. Edit your policy and choose **Next** to see your changes reflected in the policy summary. If you still see a problem, choose **Previous** to return to the editing screen.
5. Choose **Save changes** to save your changes.

You can edit a policy for your policy summary using the **JSON** option.

To edit a policy for your policy summary using the JSON option

1. Open the policy summary as explained in the previous procedures.
2. You can use the **Summary** and **JSON** buttons to compare the policy summary to the JSON policy document. You can use this information to determine which lines in the policy document you want to change.
3. Choose **Edit** and then choose the **JSON** option to edit the JSON policy document.

> **Note**
>
> You can switch between the **Visual** and **JSON** editor options any time. However, if you make changes or choose **Next** in the **Visual** editor option, IAM might restructure your policy to optimize it for the visual editor. For more information, see Policy restructuring.

If you are on the **Users** page and choose to edit a customer managed policy that is attached to that user, you are redirected to the **Policies** page. You can edit customer managed policies only on the **Policies** page.

4. Edit your policy. Resolve any security warnings, errors, or general warnings generated during policy validation, and then choose **Next**. If you still see a problem, choose **Previous** to return to the editing screen.
5. Choose **Save changes** to save your changes.

Access levels in policy summaries

AWS access level summary

Policy summaries include an access level summary that describes the action permissions defined for each service that is mentioned in the policy. To learn about policy summaries, see Policy summaries. Access level summaries indicate whether the actions in each access level (`List`, `Read`, `Tagging`, `Write`, and `Permissions management`) have `Full` or `Limited` permissions defined in the policy. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.

The following example describes the access provided by a policy for the given services. For examples of full JSON policy documents and their related summaries, see Examples of policy summaries.

Service	Access level	This policy provides the following
IAM	Full access	Access to all actions within the IAM service.
CloudWatch	**Full:** List	Access to all CloudWatch actions in the `List` access level, but no access to actions with the `Read`, `Write`, or `Permissions management` access level classification.
Data Pipeline	**Limited:** List, Read	Access to at least one but not all AWS Data Pipeline actions in the `List` and `Read` access level, but not the `Write` or `Permissions management` actions.
EC2	**Full:** List, Read **Limited:** Write	Access to all Amazon EC2 `List` and `Read` actions and access to at least one but not all Amazon EC2 `Write` actions, but no access to

Service	Access level	This policy provides the following
		actions with the `Permissions management` access level classification.
S3	**Limited:** Read, Write, Permissions management	Access to at least one but not all Amazon S3 `Read`, `Write` and `Permissions management` actions.
CodeDeploy	(empty)	Unknown access, because IAM does not recognize this service.
API Gateway	None	No access is defined in the policy.
CodeBuild	⚠ No actions are defined.	No access because no actions are defined for the service. To learn how to understand and troubleshoot this issue, see the section called "My policy does not grant the expected permissions".

In a policy summary, **Full access** indicates that the policy provides access to all the actions within the service. Policies that provide access to some but not all actions within a service are further grouped according to the access level classification. This is indicated by one of the following access-level groupings:

- **Full**: The policy provides access to all actions within the specified access level classification.
- **Limited**: The policy provides access to one or more but not all actions within the specified access level classification.
- **None**: The policy provides no access.
- (empty): IAM does not recognize this service. If the service name includes a typo, then the policy provides no access to the service. If the service name is correct, then the service might not support policy summaries or might be in preview. In this case, the policy might provide access, but that access cannot be shown in the policy summary. To request policy summary support for a generally available (GA) service, see Service does not support IAM policy summaries.

Access level summaries that include limited (partial) access to actions are grouped using the AWS access level classifications `List`, `Read`, `Tagging`, `Write`, or `Permissions management`.

AWS access levels

AWS defines the following access level classifications for the actions in a service:

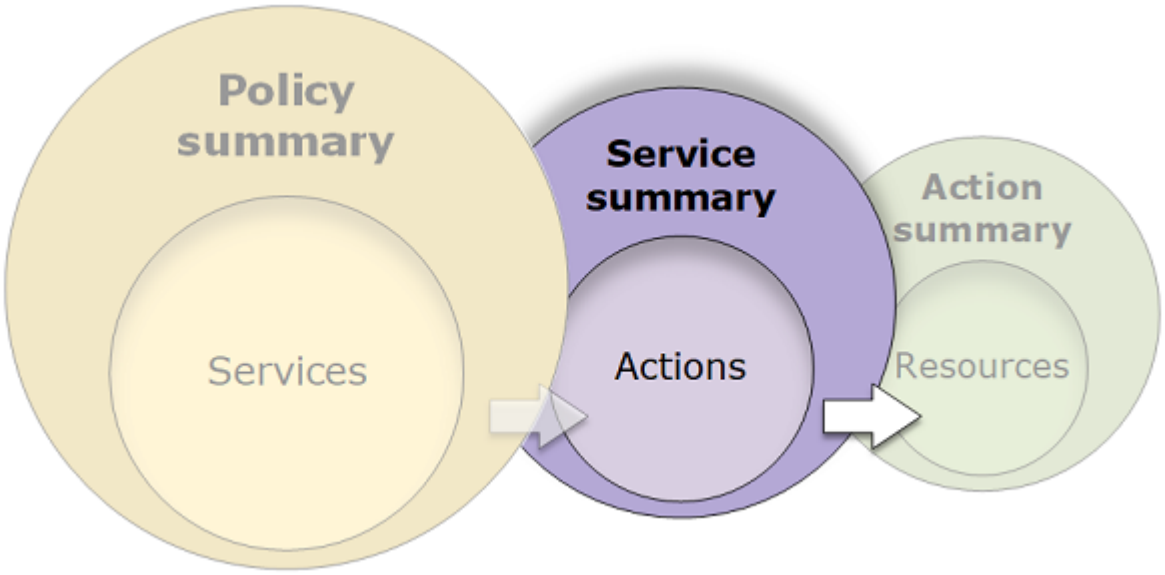
- **List**: Permission to list resources within the service to determine whether an object exists. Actions with this level of access can list objects but cannot see the contents of a resource. For example, the Amazon S3 action `ListBucket` has the **List** access level.
- **Read**: Permission to read but not edit the contents and attributes of resources in the service. For example, the Amazon S3 actions `GetObject` and `GetBucketLocation` have the **Read** access level.
- **Tagging**: Permission to perform actions that only change the state of resource tags. For example, the IAM actions `TagRole` and `UntagRole` have the **Tagging** access level because they allow only tagging or untagging a role. However, the `CreateRole` action allows tagging a role resource when you create that role. Because the action does not only add a tag, it has the `Write` access level.
- **Write**: Permission to create, delete, or modify resources in the service. For example, the Amazon S3 actions `CreateBucket`, `DeleteBucket` and `PutObject` have the **Write** access level. `Write` actions might also allow modifying a resource tag. However, an action that allows only changes to tags has the `Tagging` access level.
- **Permissions management**: Permissions management refers to actions that control access within AWS services, including IAM and non-IAM identity permissions, but excludes network-level access controls like security groups. For example, most IAM and AWS Organizations actions, as well as the Amazon S3 actions `PutBucketPolicy` and `DeleteBucketPolicy` have the **Permissions management** access level.

> **Tip**
>
> To improve the security of your AWS account, restrict or regularly monitor policies that include the **Permissions management** access level classification.

To view the access level classification for all of the actions in a service, see Actions, Resources, and Condition Keys for AWS Services.

Service summary (list of actions)

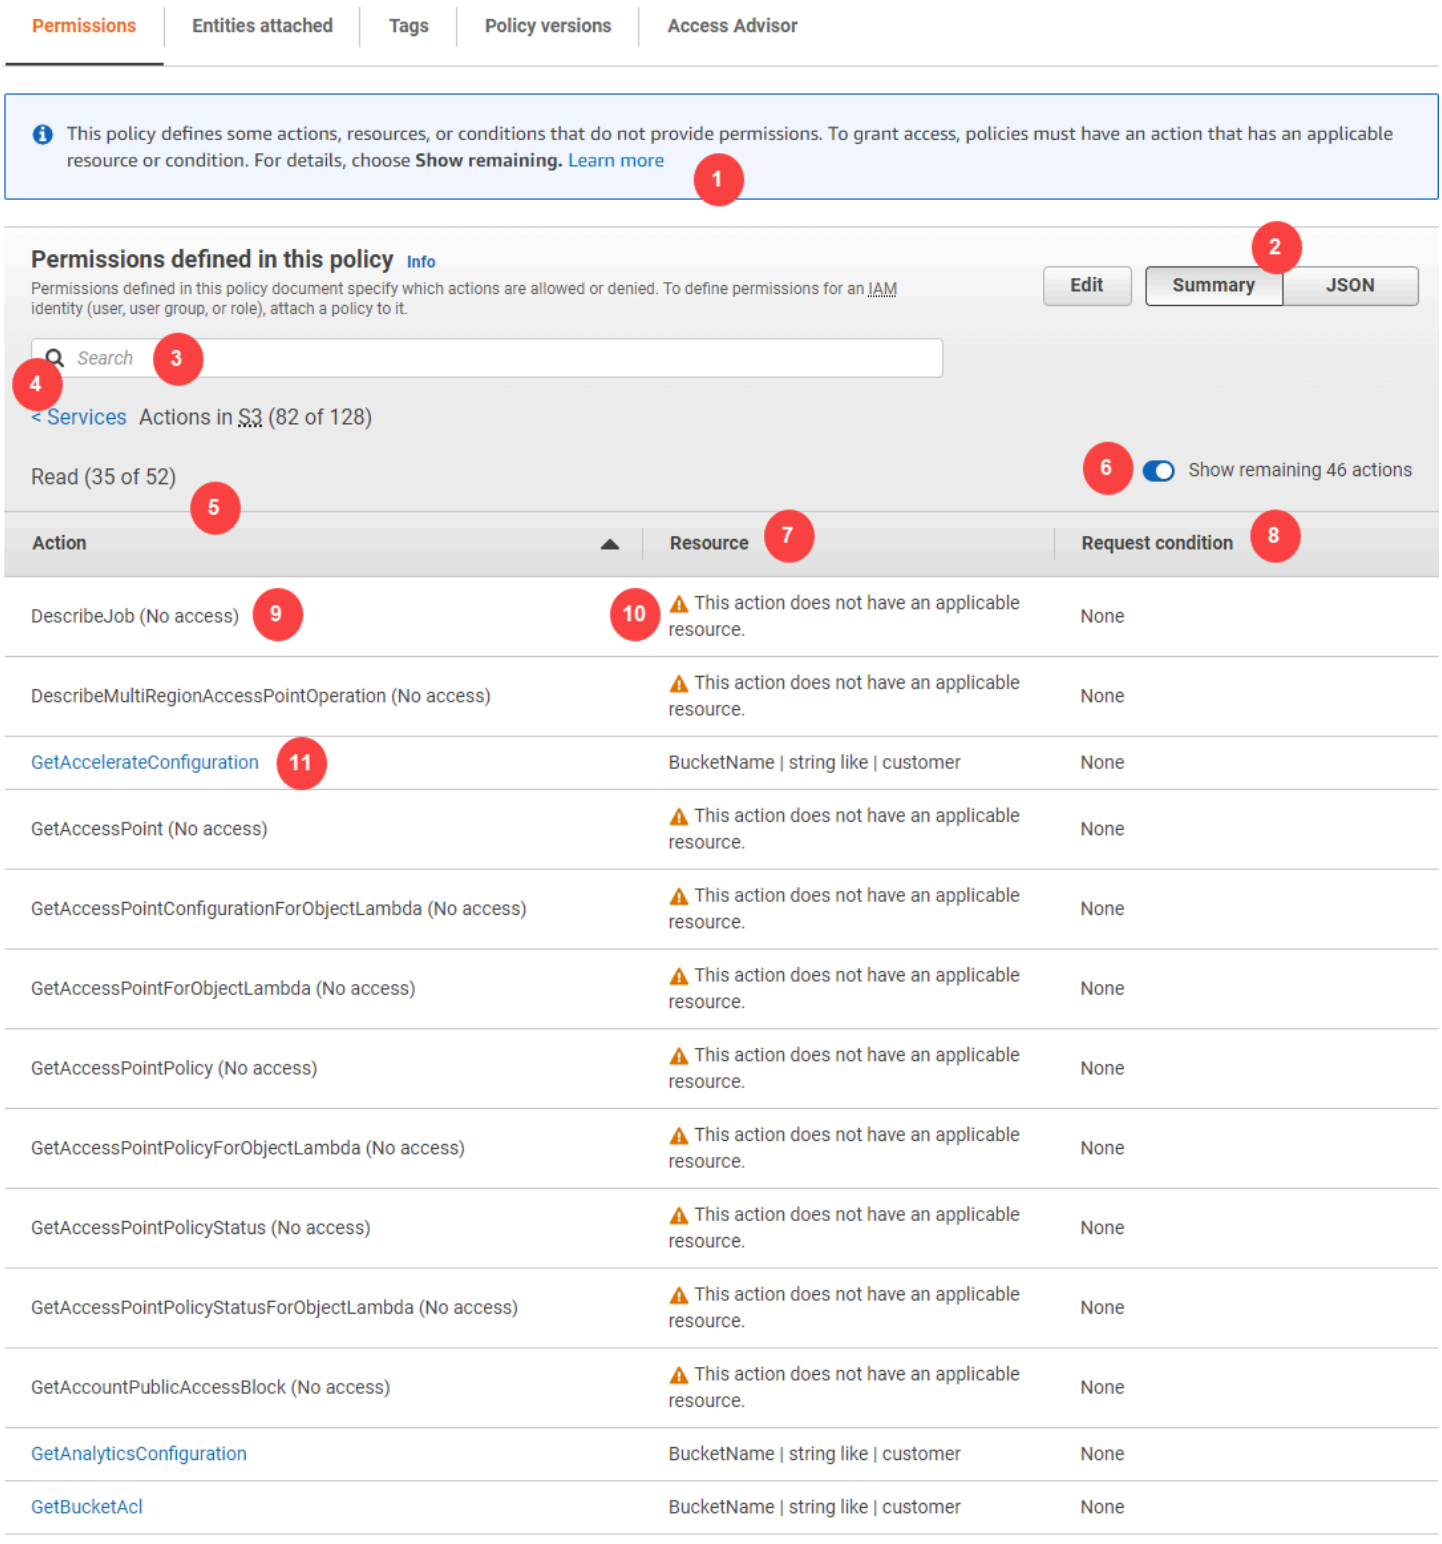
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *service summary* table includes a list of the actions and summaries of the permissions that are defined by the policy for the chosen service.



You can view a service summary for each service listed in the policy summary that grants permissions. The table is grouped into **Uncategorized actions**, **Uncategorized resource types**, and access level sections. If the policy includes an action that IAM does not recognize, then the action is included in the **Uncategorized actions** section of the table. If IAM recognizes the action, then it is included under one of the access level (**List**, **Read**, **Write** and **Permissions management**) sections of the table. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.

Understanding the elements of a service summary

The example below is the service summary for Amazon S3 actions that are allowed from a policy summary. The actions for this service are grouped by access level. For example, 35 **Read** actions are defined out of the total 52 **Read** actions available for the service.



The service summary page for a managed policy includes the following information:

1. If the policy does not grant permissions to all the actions, resources, and conditions defined for the service in the policy, then a warning banner appears at the top of the page. The service

summary then includes details about the problem. To learn how policy summaries help you to understand and troubleshoot the permissions that your policy grants, see the section called "My policy does not grant the expected permissions".

2. Choose **JSON** to see additional details about the policy. You can do this to view all conditions that are applied to the actions. (If you are viewing the service summary for an inline policy that is attached directly to a user, you must close the service summary dialog box and return to the policy summary to access the JSON policy document.)
3. To view the summary for a specific action, type keywords into the **Search** box to reduce the list of available actions.
4. Next to the **Services** back arrow appears the name of the service (in this case **S3**). The service summary for this service includes the list of allowed or denied actions that are defined in the policy. If the service appears under **(Explicit deny)** on the **Permissions** tab, then the actions listed in the service summary table are explicitly denied. If the service appears under **Allow** on the **Permissions** tab, then the actions listed in the service summary table are allowed.
5. **Action** – This column lists the actions that are defined within the policy and provides the resources and conditions for each action. If the policy grants or denies permissions to the action, then the action name links to the *action summary* table. The table groups these actions into at least one or up to five sections, depending on the level of access that the policy allows or denies. The sections are **List**, **Read**, **Write**, **Permission Management**, and **Tagging**. The count indicates the number of recognized actions that provide permissions within each access level. The total is the number of known actions for the service. In this example, 35 actions provide permissions out of 52 total known Amazon S3 **Read** actions. To view the access level classification that is assigned to each action in a service, see Actions, Resources, and Condition Keys for AWS Services.
6. **Show remaining actions** – Toggle this button to expand or hide the table to include actions that are known but do not provide permissions for this service. Toggling the button also displays warnings for any elements that do not provide permissions.
7. **Resource** – This column shows the resources that the policy defines for the service. IAM does not check whether the resource applies to each action. In this example, actions in the Amazon S3 service are allowed on only the `developer_bucket` Amazon S3 bucket resource. Depending on the information that the service provides to IAM, you might see an ARN such as `arn:aws:s3:::developer_bucket/*`, or you might see the defined resource type, such as `BucketName = developer_bucket`.

> **Note**
>
> This column can include a resource from a different service. If the policy statement that includes the resource does not include both actions and resources from the same service, then your policy includes mismatched resources. IAM does not warn you about mismatched resources when you create a policy, or when you view a policy in the service summary. IAM also does not indicate whether the action applies to the resources, only whether the service matches. If this column includes a mismatched resource, then you should review your policy for errors. To better understand your policies, always test them with the policy simulator.

8. **Request condition** – This column tells whether the actions associated with the resource are subject to conditions. To learn more about those conditions, choose **JSON** to review the JSON policy document.
9. **(No access)** – This policy includes an action that does not provide permissions.
10. **Resource warning** – For actions with resources that do not provide full permissions, you see one of the following warnings:
    - **This action does not support resource-level permissions. This requires a wildcard (*) for the resource.** – This means that the policy includes resource-level permissions but must include `"Resource": ["*"]` to provide permissions for this action.
    - **This action does not have an applicable resource.** – This means that the action is included in the policy without a supported resource.
    - **This action does not have an applicable resource and condition.** – This means that the action is included in the policy without a supported resource and without a supported condition. In this case, there is also condition included in the policy for this service, but there are no conditions that apply to this action.
11. Actions that provide permissions include a link to the action summary.

View service summaries

You can view a service summary for each service listed in the policy summary that grants permissions.

Viewing service summaries from the Policies page

You can view the service summary for managed policies on the **Policies** page.

To view the service summary for a managed policy

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.
5. In the policy summary list of services, choose the name of the service that you want to view.

Viewing a service summary for a policy attached to a user

You can view the service summary for any policies that are attached to an IAM user.

To view the service summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Users**.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, choose the name of the policy that you want to view.

   If you are on the **Users** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. Choose **Summary**. In the policy summary list of services, choose the name of the service that you want to view.

> **Note**
>
> If the policy that you select is an inline policy that is attached directly to the user, then the service summary table appears. If the policy is an inline policy attached from a group, then you are taken to the JSON policy document for that group. If the policy is a managed policy, then you are taken to the service summary for that policy on the **Policies** page.

Viewing a service summary for a policy attached to a role

You can view the policy summary for any policies that are attached to a role.

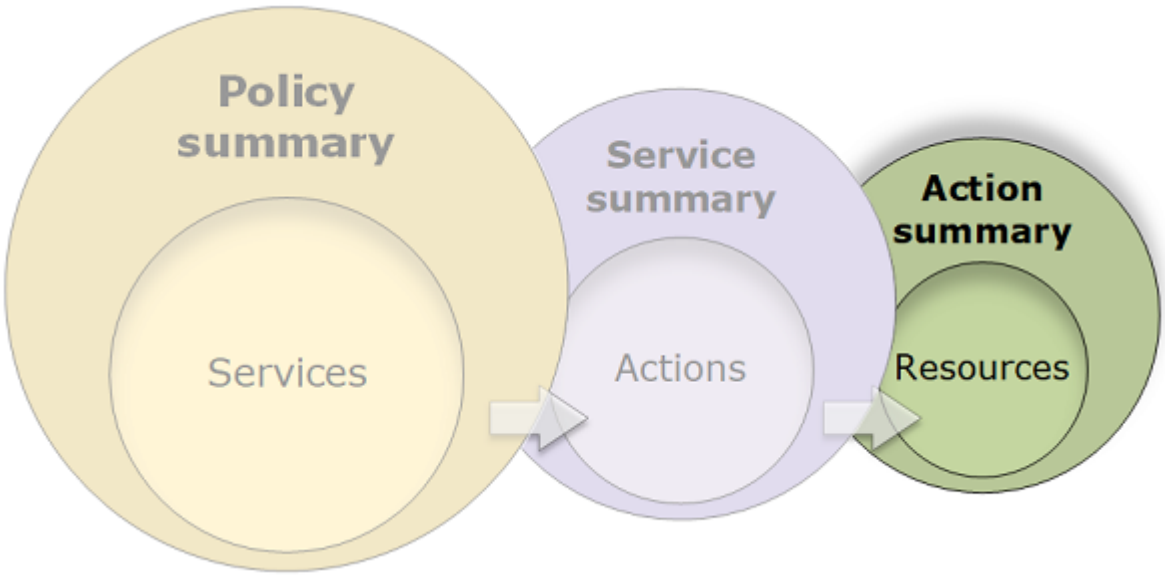
To view the service summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Roles** from the navigation pane.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, choose the name of the policy that you want to view.

   If you are on the **Roles** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.

Action summary (list of resources)

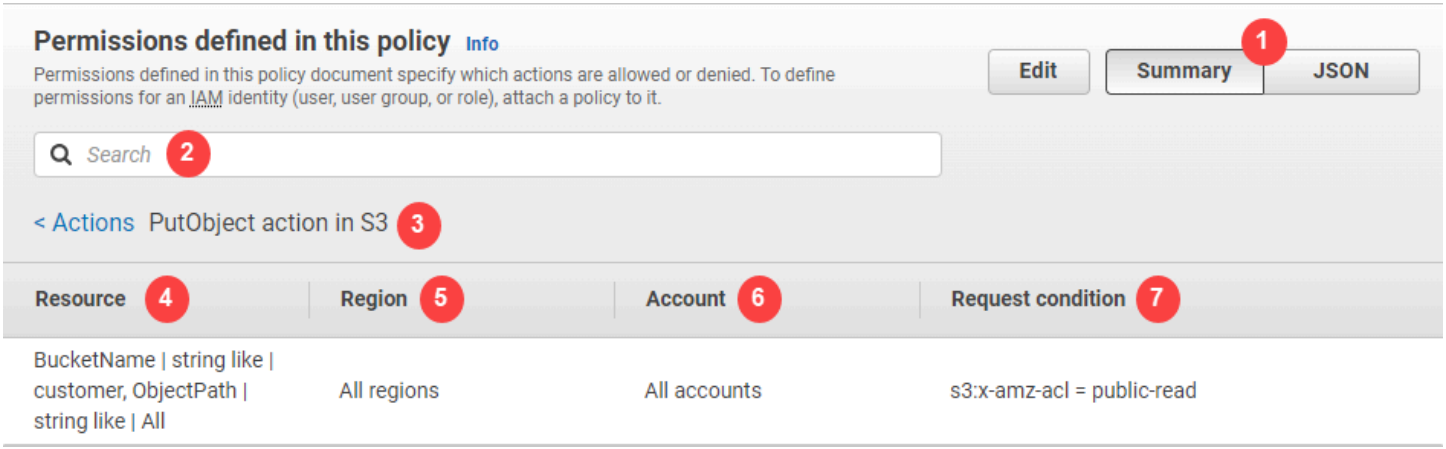
Policies are summarized in three tables: the policy summary, the service summary, and the action summary. The *action summary* table includes a list of resources and the associated conditions that apply to the chosen action.



To view an action summary for each action that grants permissions, choose the link in the service summary. The action summary table includes details about the resource, including its **Region** and **Account**. You can also view the conditions that apply to each resource. This shows you conditions that apply to some resources but not others.

Understanding the elements of an action summary

The example below is the action summary for the `PutObject` (Write) action from the Amazon S3 service summary (see Service summary (list of actions)). For this action, the policy defines multiple conditions on a single resource.



The action summary page includes the following information:

1. Choose **JSON** to see additional details about the policy, such as viewing the multiple conditions that are applied to the actions. (If you are viewing the action summary for an inline policy that is attached directly to a user, the steps differ. To access the JSON policy document in that case, you must close the action summary dialog box and return to the policy summary.)
2. To view the summary for a specific resource, type keywords into the **Search** box to reduce the list of available resources.
3. Next to the **Actions** back arrow appears the name of the service and action in the format `action name action in service` (in this case **PutObject action in S3**). The action summary for this service includes the list of resources that are defined in the policy.
4. **Resource** – This column lists the resources that the policy defines for the chosen service. In this example, the **PutObject** action is allowed on all object paths, but on only the `developer_bucket` Amazon S3 bucket resource. Depending on the information that the service provides to IAM, you might see an ARN such as `arn:aws:s3:::developer_bucket/`

*, or you might see the defined resource type, such as `BucketName = developer_bucket, ObjectPath = All`.

5. **Region** – This column shows the Region in which the resource is defined. Resources can be defined for all Regions, or a single Region. They cannot exist in more than one specific Region.
   - **All regions** – The actions that are associated with the resource apply to all Regions. In this example, the action belongs to a global service, Amazon S3. Actions that belong to global services apply to all Regions.
   - Region text – The actions associated with the resource apply to one Region. For example, a policy can specify the `us-east-2` Region for a resource.
6. **Account** – This column indicates whether the services or actions associated with the resource apply to a specific account. Resources can exist in all accounts or a single account. They cannot exist in more than one specific account.
   - **All accounts** – The actions that are associated with the resource apply to all accounts. In this example, the action belongs to a global service, Amazon S3. Actions that belong to global services apply to all accounts.
   - **This account** – The actions that are associated with the resource apply only in the current account..
   - Account number – The actions that are associated with the resource apply to one account (one that you are not currently logged in to). For example, if a policy specifies the `123456789012` account for a resource, then the account number appears in the policy summary.
7. **Request condition** – This column shows whether the actions that are associated with the resource are subject to conditions. This example includes the `s3:x-amz-acl = public-read` condition. To learn more about those conditions, choose **JSON** to review the JSON policy document.

View action summaries

You can view an action summary for each action listed in the policy summary that grants permissions.

Viewing action summaries from the Policies page

You can view the action summary for managed policies.

To view the action summary for a managed policy

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, choose the name of the policy that you want to view.
4. On the **Policy details** page for the policy, view the **Permissions** tab to see the policy summary.
5. In the policy summary list of services, choose the name of the service that you want to view.
6. In the service summary list of actions, choose the name of the action that you want to view.

Viewing action summaries for a policy attached to a user

You can view the action summary for any policy that is attached to a user.

To view the action summary for a policy attached to a user

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Users** from the navigation pane.
3. In the list of users, choose the name of the user whose policy you want to view.
4. On the **Summary** page for the user, view the **Permissions** tab to see the list of policies that are attached to the user directly or from a group.
5. In the table of policies for the user, choose the name of the policy that you want to view.

   If you are on the **Users** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.

> **Note**
>
> If the policy that you select is an inline policy that is attached directly to the user, then the service summary table appears. If the policy is an inline policy attached from a group, then you are taken to the JSON policy document for that group. If the policy is a managed policy, then you are taken to the service summary for that policy on the **Policies** page.

7. In the service summary list of actions, choose the name of the action that you want to view.

Viewing action summaries for a policy attached to a role

You can view the action summary for any policy that is attached to a role.

To view the action summary for a policy attached to a role

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. In the list of roles, choose the name of the role whose policy you want to view.
4. On the **Summary** page for the role, view the **Permissions** tab to see the list of policies that are attached to the role.
5. In the table of policies for the role, choose the name of the policy that you want to view.

   If you are on the **Roles** page and choose to view the service summary for a policy that is attached to that user, you are redirected to the **Policies** page. You can view service summaries only on the **Policies** page.
6. In the policy summary list of services, choose the name of the service that you want to view.
7. In the service summary list of actions, choose the name of the action that you want to view.

Examples of policy summaries

The following examples include JSON policies with their associated policy summaries, the service summaries, and the action summaries to help you understand the permissions given through a policy.

Policy 1: DenyCustomerBucket

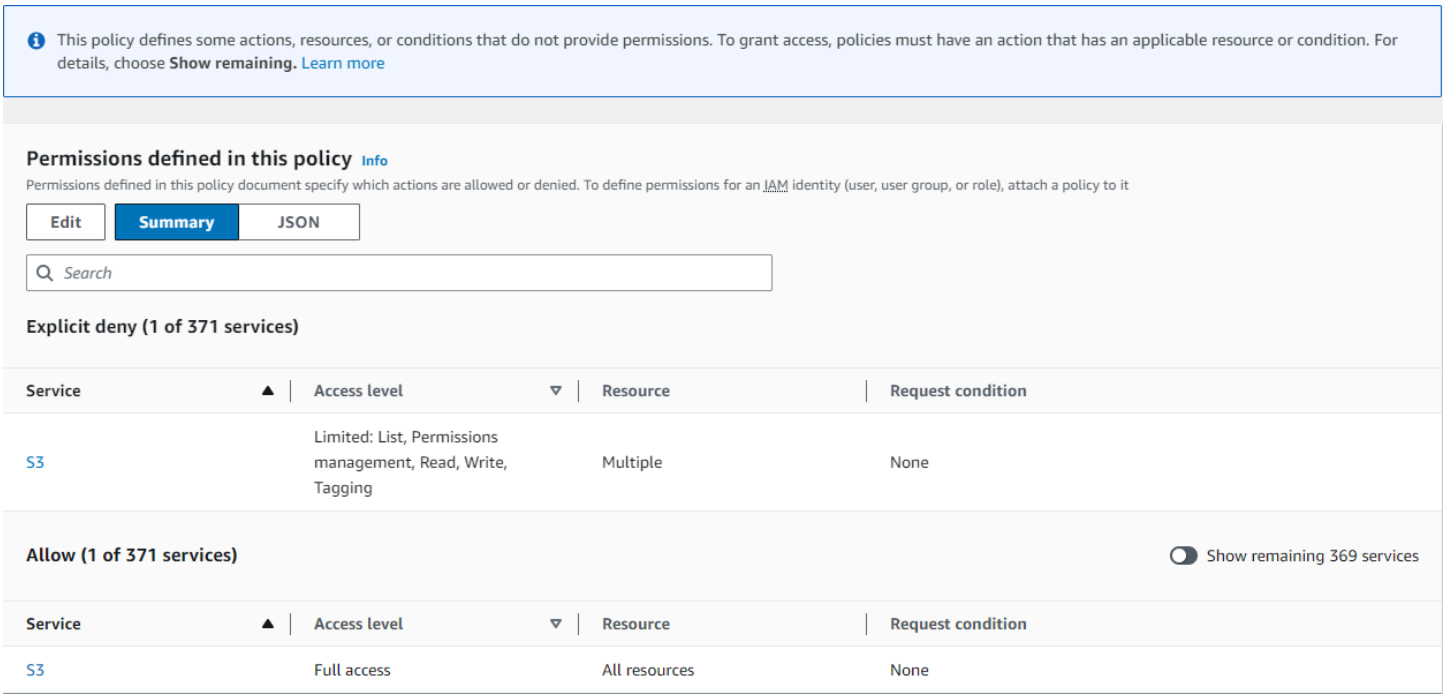
This policy demonstrates an allow and a deny for the same service.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
```

```
        {
            "Sid": "FullAccess",
            "Effect": "Allow",
            "Action": ["s3:*"],
            "Resource": ["*"]
        },
        {
            "Sid": "DenyCustomerBucket",
            "Action": ["s3:*"],
            "Effect": "Deny",
            "Resource": ["arn:aws:s3:::customer", "arn:aws:s3:::customer/*" ]
        }
    ]
}
```

***DenyCustomerBucket** Policy Summary:*



***DenyCustomerBucket S3 (Explicit deny)** Service Summary:*

< Services Actions in S3 (82 of 130) Show remaining 48 actions

Policy 2: DynamoDbRowCognitoID

This policy provides row-level access to Amazon DynamoDB based on the user's Amazon Cognito ID.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "dynamodb:DeleteItem",
                "dynamodb:GetItem",
                "dynamodb:PutItem",
                "dynamodb:UpdateItem"
            ],
            "Resource": [
                "arn:aws:dynamodb:us-west-1:123456789012:table/myDynamoTable"
            ],
            "Condition": {
                "ForAllValues:StringEquals": {
                    "dynamodb:LeadingKeys": [
                        "${cognito-identity.amazonaws.com:sub}"
                    ]
                }
            }
        }
    ]
}
```

Policy 5: CodeBuild_CodeCommit_CodeDeploy

This policy provides access to specific CodeBuild, CodeCommit, and CodeDeploy resources. Because these resources are specific to each service, they appear only with the matching service. If you include a resource that does not match any services in the `Action` element, then the resource appears in all action summaries.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "Stmt1487980617000",

Permissions required to access IAM resources

Resources are objects within a service. IAM resources include groups, users, roles, and policies. If you are signed in with AWS account root user credentials, you have no restrictions on administering IAM credentials or IAM resources. However, IAM users must explicitly be given permissions to administer credentials or IAM resources. You can do this by attaching an identity-based policy to the user.

> **Note**
>
> Throughout the AWS documentation, when we refer to an IAM policy without mentioning any of the specific categories, we mean an identity-based, customer managed policy. For details about policy categories, see the section called “Policies and permissions”.

Permissions for administering IAM identities

The permissions that are required to administer IAM groups, users, roles, and credentials usually correspond to the API actions for the task. For example, in order to create IAM users, you must have the `iam:CreateUser` permission that has the corresponding API command: `CreateUser`. To allow an IAM user to create other IAM users, you could attach an IAM policy like the following one to that user:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": "iam:CreateUser",
    "Resource": "*"
  }
}
```

In a policy, the value of the `Resource` element depends on the action and what resources the action can affect. In the preceding example, the policy allows a user to create any user (* is a wildcard that matches all strings). In contrast, a policy that allows users to change only their own access keys (API actions `CreateAccessKey` and `UpdateAccessKey`) typically has a `Resource`

element. In this case the ARN includes a variable (`${aws:username}`) that resolves to the current user's name, as in the following example:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "ListUsersForConsole",
            "Effect": "Allow",
            "Action": "iam:ListUsers",
            "Resource": "arn:aws:iam::*:*"
        },
        {
            "Sid": "ViewAndUpdateAccessKeys",
            "Effect": "Allow",
            "Action": [
                "iam:UpdateAccessKey",
                "iam:CreateAccessKey",
                "iam:ListAccessKeys"
            ],
            "Resource": "arn:aws:iam::*:user/${aws:username}"
        }
    ]
}
```

In the previous example, `${aws:username}` is a variable that resolves to the user name of the current user. For more information about policy variables, see IAM policy elements: Variables and tags.

Using a wildcard character (*) in the action name often makes it easier to grant permissions for all the actions related to a specific task. For example, to allow users to perform any IAM action, you can use `iam:*` for the action. To allow users to perform any action related just to access keys, you can use `iam:*AccessKey*` in the `Action` element of a policy statement. This gives the user permission to perform the `CreateAccessKey`, `DeleteAccessKey`, `GetAccessKeyLastUsed`, `ListAccessKeys`, and `UpdateAccessKey` actions. (If an action is added to IAM in the future that has "AccessKey" in the name, using `iam:*AccessKey*` for the `Action` element will also give the user permission to that new action.) The following example shows a policy that allows users

to perform all actions pertaining to their own access keys (replace *account-id* with your AWS account ID):

JSON

```
{
    "Version":"2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Action": "iam:*AccessKey*",
        "Resource": "arn:aws:iam::111122223333:user/${aws:username}"
    }
}
```

Some tasks, such as deleting a group, involve multiple actions: You must first remove users from the group, then detach or delete the group's policies, and then actually delete the group. If you want a user to be able to delete a group, you must be sure to give the user permissions to perform all of the related actions.

Permissions for working in the AWS Management Console

The preceding examples show policies that allow a user to perform the actions with the AWS CLI or the AWS SDKs.

As users work with the console, the console issues requests to IAM to list groups, users, roles, and policies, and to get the policies associated with a group, user, or role. The console also issues requests to get AWS account information and information about the principal. The principal is the user making requests in the console.

In general, to perform an action, you must have only the matching action included in a policy. To create a user, you need permission to call the `CreateUser` action. Often, when you use the console to perform an action, you must have permissions to display, list, get, or otherwise view resources in the console. This is necessary so that you can navigate through the console to make the specified action. For example, if user Jorge wants to use the console to change his own access keys, he goes to the IAM console and chooses **Users**. This action causes the console to make a `ListUsers` request. If Jorge doesn't have permission for the `iam:ListUsers` action, the console is denied access when it tries to list users. As a result, Jorge can't get to his own name and to his

own access keys, even if he has permissions for the `CreateAccessKey` and `UpdateAccessKey` actions.

If you want to give users permissions to administer groups, users, roles, policies, and credentials with the AWS Management Console, you need to include permissions for the actions that the console performs. For some examples of policies that you can use to grant a user for these permissions, see Example policies for administering IAM resources.

Grant permissions across AWS accounts

You can directly grant IAM users in your own account access to your resources. If users from another account need access to your resources, you can create an IAM role, which is an entity that includes permissions but that isn't associated with a specific user. Users from other accounts can then use the role and access resources according to the permissions you've assigned to the role. For more information, see Access for an IAM user in another AWS account that you own.

> **Note**
>
> Some services support resource-based policies as described in Identity-based policies and resource-based policies (such as Amazon S3, Amazon SNS, and Amazon SQS). For those services, an alternative to using roles is to attach a policy to the resource (bucket, topic, or queue) that you want to share. The resource-based policy can specify the AWS account that has permissions to access the resource.

Permissions for one service to access another

Many AWS services access other AWS services. For example, several AWS services—including Amazon EMR, Elastic Load Balancing, and Amazon EC2 Auto Scaling—manage Amazon EC2 instances. Other AWS services make use of Amazon S3 buckets, Amazon SNS topics, Amazon SQS queues, and so on.

The scenario for managing permissions in these cases varies by service. Here are some examples of how permissions are handled for different services:

- In Amazon EC2 Auto Scaling, users must have permission to use Auto Scaling, but don't need to be explicitly granted permission to manage Amazon EC2 instances.

- In AWS Data Pipeline, an IAM role determines what a pipeline can do; users need permission to assume the role. (For details, see Granting Permissions to Pipelines with IAM in the *AWS Data Pipeline Developer Guide*.)

For details about how to configure permissions properly so that an AWS service is able to accomplish the tasks you intend, refer to the documentation for the service you are calling. To learn how to create a role for a service, see Create a role to delegate permissions to an AWS service.

Configuring a service with an IAM role to work on your behalf

When you want to configure an AWS service to work on your behalf, you typically provide the ARN for an IAM role that defines what the service is allowed to do. AWS checks to ensure that you have permissions to pass a role to a service. For more information, see Grant a user permissions to pass a role to an AWS service.

Required actions

Actions are the things that you can do to a resource, such as viewing, creating, editing, and deleting that resource. Actions are defined by each AWS service.

To allow someone to perform an action, you must include the necessary actions in a policy that applies to the calling identity or the affected resource. In general, to provide the permission required to perform an action, you must include that action in your policy. For example, to create a user, you need add the CreateUser action to your policy.

In some cases, an action might require that you include additional related actions in your policy. For example, to provide permission for someone to create a directory in AWS Directory Service using the `ds:CreateDirectory` operation, you must include the following actions in their policy:

- `ds:CreateDirectory`
- `ec2:DescribeSubnets`
- `ec2:DescribeVpcs`
- `ec2:CreateSecurityGroup`
- `ec2:CreateNetworkInterface`
- `ec2:DescribeNetworkInterfaces`
- `ec2:AuthorizeSecurityGroupIngress`

- `ec2:AuthorizeSecurityGroupEgress`

When you create or edit a policy using the visual editor, you receive warnings and prompts to help you choose all of the required actions for your policy.

For more information about the permissions required to create a directory in AWS Directory Service, see Example 2: Allow a User to Create a Directory.

Example policies for administering IAM resources

Following are examples of IAM policies that allow users to perform tasks associated with managing IAM users, groups, and credentials. This includes policies that permit users manage their own passwords, access keys, and multi-factor authentication (MFA) devices.

For examples of policies that let users perform tasks with other AWS services, like Amazon S3, Amazon EC2, and DynamoDB, see Example IAM identity-based policies.

Topics

- Allow a user to list the account's groups, users, policies, and more for reporting purposes
- Allow a user to manage a group's membership
- Allow a user to manage IAM users
- Allow users to set account password policy
- Allow users to generate and retrieve IAM credential reports
- Allow all IAM actions (admin access)

Allow a user to list the account's groups, users, policies, and more for reporting purposes

The following policy allows the user to call any IAM action that starts with the string `Get` or `List`, and to generate reports. To view the example policy, see IAM: Allows read-only access to the IAM console.

Allow a user to manage a group's membership

The following policy allows the user to update the membership of the group called *MarketingGroup*. To view the example policy, see IAM: Allows managing a group's membership programmatically and in the console.

Allow a user to manage IAM users

The following policy allows a user to perform all the tasks associated with managing IAM users but not to perform actions on other entities, such as creating groups or policies. Allowed actions include these:

- Creating the user (the `CreateUser` action).
- Deleting the user. This task requires permissions to perform all of the following actions: `DeleteSigningCertificate`, `DeleteLoginProfile`, `RemoveUserFromGroup`, and `DeleteUser`.
- Listing users in the account and in groups (the `GetUser`, `ListUsers` and `ListGroupsForUser` actions).
- Listing and removing policies for the user (the `ListUserPolicies`, `ListAttachedUserPolicies`, `DetachUserPolicy`, `DeleteUserPolicy` actions)
- Renaming or changing the path for the user (the `UpdateUser` action). The `Resource` element must include an ARN that covers both the source path and the target path. For more information on paths, see Friendly names and paths.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowUsersToPerformUserActions",
            "Effect": "Allow",
            "Action": [
                "iam:ListPolicies",
                "iam:GetPolicy",
                "iam:UpdateUser",
                "iam:AttachUserPolicy",
                "iam:ListEntitiesForPolicy",
                "iam:DeleteUserPolicy",
                "iam:DeleteUser",
                "iam:ListUserPolicies",
                "iam:CreateUser",
                "iam:RemoveUserFromGroup",
                "iam:AddUserToGroup",
```

```
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:PutUserPolicy",
                "iam:ListAttachedUserPolicies",
                "iam:ListUsers",
                "iam:GetUser",
                "iam:DetachUserPolicy"
            ],
            "Resource": "*"
        },
        {
            "Sid": "AllowUsersToSeeStatsOnIAMConsoleDashboard",
            "Effect": "Allow",
            "Action": [
                "iam:GetAccount*",
                "iam:ListAccount*"
            ],
            "Resource": "*"
        }
    ]
}
```

A number of the permissions included in the preceding policy allow the user to perform tasks in the AWS Management Console. Users who perform user-related tasks from the AWS CLI, the AWS SDKs, or the IAM HTTP query API only might not need certain permissions. For example, if users already know the ARN of policies to detach from a user, they do not need the `iam:ListAttachedUserPolicies` permission. The exact list of permissions that a user requires depends on the tasks that the user must perform while managing other users.

The following permissions in the policy allow access to user tasks via the AWS Management Console:

- `iam:GetAccount*`
- `iam:ListAccount*`

Allow users to set account password policy

You might give some users permissions to get and update the password policy of your AWS account. To view the example policy, see IAM: Allows setting the account password requirements programmatically and in the console.

Allow users to generate and retrieve IAM credential reports

You can give users permission to generate and download a report that lists all users in your AWS account. The report also lists the status of various user credentials, including passwords, access keys, MFA devices, and signing certificates. For more information about credential reports, see Generate credential reports for your AWS account. To view the example policy, see IAM: Generate and retrieve IAM credential reports.

Allow all IAM actions (admin access)

You might give some users administrative permissions to perform all actions in IAM, including managing passwords, access keys, MFA devices, and user certificates. The following example policy grants these permissions.

> **Warning**
>
> When you give a user full access to IAM, there is no limit to the permissions that user can grant to him/herself or others. The user can create new IAM entities (users or roles) and grant those entities full access to all resources in your AWS account. When you give a user full access to IAM, you are effectively giving them full access to all resources in your AWS account. This includes access to delete all resources. You should grant these permissions to only trusted administrators, and you should enforce multi-factor authentication (MFA) for these administrators.

    "Effect": "Allow",
    "Action": "iam:*",
    "Resource": "*"
  }
}
```

IAM temporary delegation

Overview

Temporary delegation accelerates onboarding and simplifies management for products from Amazon and AWS Partners that integrate with your AWS accounts. Instead of manually configuring multiple AWS services, you can delegate temporary, limited permissions that allow the product provider to complete setup tasks on your behalf in minutes through automated deployment workflows. You maintain administrative control with approval requirements and permission boundaries, while product provider permissions automatically expire after the approved duration with no manual cleanup required. If the product requires persistent access for ongoing operations, the provider can use temporary delegation to create an IAM role with a permission boundary that defines the role's maximum permissions. All product provider activity is tracked through AWS CloudTrail for compliance and security monitoring.

> **Note**
>
> Temporary delegation requests can only be created by Amazon products and qualified AWS Partners that have completed the feature onboarding process. Customers review and approve these requests but cannot create them directly. If you are an AWS Partner looking to integrate IAM temporary delegation into your product, see the Partner Integration Guide for onboarding and integration instructions.

How temporary delegation works

Temporary delegation enables Amazon and AWS Partners to request temporary, limited access to your account. Upon your approval, they can use delegated permissions to take actions on your behalf. Delegation requests define specific permissions to AWS services and actions that the product provider needs to deploy or configure resources in your AWS account. These permissions are only available for a limited time and automatically expire after the duration specified in the request.

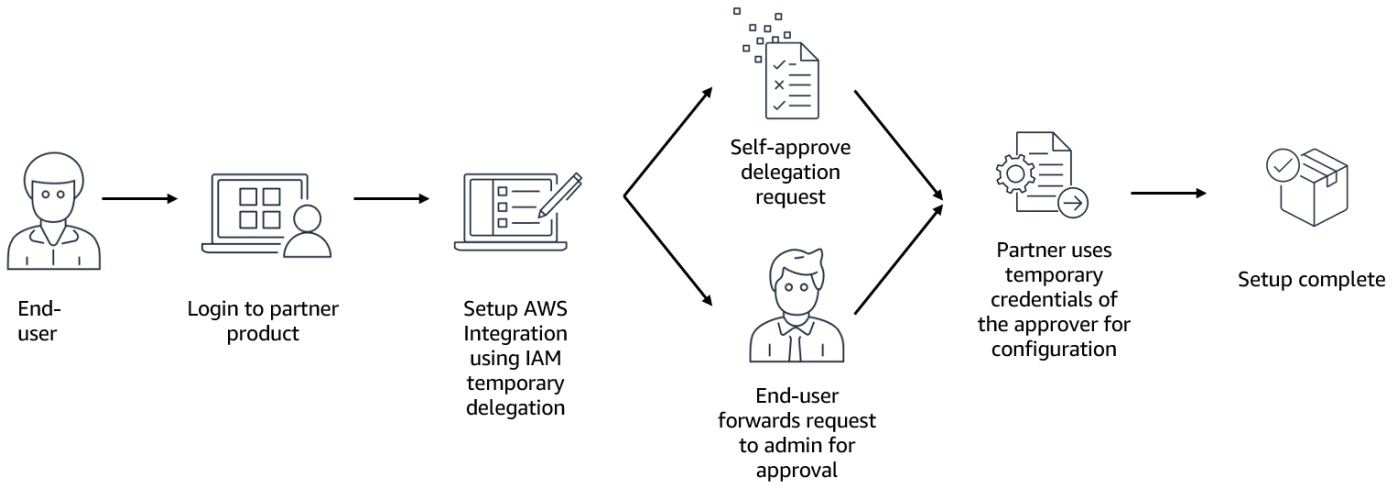
> **Note**
>
> The maximum duration for delegated access is 12 hours. However, root users can only approve delegation requests with a duration of 4 hours or less. If a request specifies more

than 4 hours, you must use a non-root identity to approve the request. For details, see Permission simulation beta capability.

For ongoing tasks, such as reading from an Amazon S3 bucket, delegation requests can include the creation of an IAM role that allows continued access to resources and actions after the temporary access expires. Product providers must attach a permission boundary to any IAM role created through temporary delegation. Permission boundaries limit a role's maximum permissions but do not grant permissions on their own. You can review the permission boundary as part of the request before approving it. For details, see Permissions boundaries.

The process works as follows:

1. You log in to an Amazon or AWS Partner product to integrate it with your AWS environment.
2. The product provider initiates a delegation request on your behalf and redirects you to the AWS Management Console.
3. You review the requested permissions and determine whether to approve, deny, or forward the request to your administrator.
4. Once you or your administrator approves the request, the product provider can obtain approver's temporary credentials to perform the required tasks.
5. Product provider access automatically expires after the specified time period. However, any IAM role created through the temporary delegation request persists beyond this period, allowing the product provider to continue accessing resources and actions for ongoing management tasks.



> **Note**
>
> You can only delegate permissions to a product provider if you have permissions to the services and actions included in the temporary delegation request. If you don't have access to the requested services and actions, the product provider does not receive these permissions when you approve the request.

If the permission check shows it is likely to succeed, you can approve the temporary delegation request and continue with the workflow.

If the permission check shows that you may not have sufficient permissions, forward the request to your administrator for approval. We recommend notifying your administrator about this request using your preferred method such as an email or a ticket.

Once your administrator approves the request, what happens next depends on the product provider's configuration:

- If the product provider requested immediate access, they automatically receive temporary permissions and the access duration begins.
- If the product provider requested release by the owner (initial recipient), you must return to the request to explicitly share temporary account access before the access duration begins. Product providers typically use this option when they need additional input from you, such as resource selection or configuration details, to complete the required task.

Initiate a temporary delegation request

You can initiate a temporary delegation request only from supported Amazon or AWS Partner products. During a workflow that supports temporary delegation, you will be prompted to grant the product provider temporary, limited permissions to configure required AWS resources in your account. This automated approach provides a more streamlined experience by eliminating the need for you to configure these resources manually.

You can review delegation request details such as the specific IAM roles, policies, and AWS services the product provider needs before granting access. You can either approve the request yourself if you have sufficient permissions, or forward the request to your account administrator for approval. All product provider access is time-bounded and can be monitored and revoked as needed.

To initiate a temporary delegation request

1. Navigate to the console of a supported product from Amazon or AWS Partners that requires integration with your AWS account.
2. Select *Deploy with IAM temporary delegation*. Note that the option name may vary across supported products. Refer to the documentation of the product provider for details.

> **Note**
>
> If you are not already signed in to the AWS Management Console, a new window opens to the AWS sign-in page. We recommend that you sign in to your AWS account before initiating the temporary delegation request from the product console. For more information about how to sign in based on your user type and the AWS resources that you want to access, see the AWS Sign-In User Guide.

3. Review the request details to confirm the product provider's product name and AWS account. You can also review the AWS identity that the product provider will use to perform actions on your behalf.
4. Review the *Access details* for the permissions that will be temporarily delegated by approving this request.

   - The *Permissions summary* section provides a high-level overview generated by AI that can help you understand what categories of AWS services can be accessed and what types of actions can be performed in each service.
   - Choose *View JSON* to review specific permissions the product provider needs to deploy in your AWS account, including access scope and resource limitations.
   - If the product provider creates an IAM role as part of a temporary delegation request, a permission boundary must be attached to the role. These IAM roles have permissions that continue to allow access to resources and actions after the requested access duration expires. Choose *View details* to review the permission boundary, which defines the maximum permissions that the role can have. The product provider will apply additional policies to the role during creation that define its actual permissions. These policies may appear more narrowly focused, or broader, than the boundary depending on how the product provider defines them. However, the permission boundary guarantees that the role's effective permissions will never exceed what you see during request approval, regardless of what policies are attached to the role. For more information, see Permissions boundaries.

5. Review the permission simulation results. The permission simulation capability automatically evaluates your identity's permissions against those included in the request. Based on this analysis, a recommendation is displayed indicating whether to approve the request with your current identity or forward the request to an administrator. For details, see [Permission simulation beta capability].
6. In the dialog, select how you would like to proceed.

   - Select *Allow access* when your identity has sufficient permissions to allow the product provider to perform onboarding procedures on your behalf. When you select this option, the product provider's access duration starts once you provide access.
   - Select *Request approval* if your identity doesn't have sufficient permissions to allow the product provider to perform onboarding procedures on your behalf. Then, choose *Create approval request*. When you select this option, a temporary delegation request link is created that you can share with your account administrator. Your administrator can access the AWS Management Console or use the access link to Review Temporary delegation requests to approve the request and share temporary access with the requestor.

> **Note**
>
> Granting product provider access requires two actions: accepting the delegation request (`AcceptDelegationRequest`) and releasing the exchange token (`SendDelegatedToken`). The AWS Management Console performs both steps automatically when you approve a request. If you use the AWS CLI or API, you must execute both steps separately.

Permission simulation capability -beta

When you receive a temporary delegation request, you can either approve it yourself or forward it to your account administrator for approval. You can only delegate permissions to a product provider if you have permissions to the services and actions included in the temporary delegation request. If you don't have access to the requested services and actions, the product provider won't receive those permissions even if they're included in the request.

For example, a temporary delegation request requires the ability to create an Amazon S3 bucket, start and stop instances in Amazon EC2, and assume an IAM role. The identity that approves the request can start and stop instances in Amazon EC2, and assume an IAM role, but does not have

permission to create an Amazon S3 bucket. When this identity approves the request, the product provider is not able to create an Amazon S3 bucket even though these permissions were included in the temporary delegation request.

Since you can only delegate permissions that you already possess, it's crucial to evaluate whether you have the requested permissions before approving. The permission simulation beta capability helps with this evaluation by comparing your permissions against those included in the request. The assessment indicates whether you can approve the request with your current identity or need to forward it to an administrator. If the analysis cannot validate that you have sufficient permissions, forward the request to an administrator for review. This assessment is based on simulated permission analysis and may differ from your live AWS environment, so review requested permissions carefully before proceeding.

Next steps

After you initiate a temporary delegation request, you can manage and monitor the request through its lifecycle. The following procedures help you track, approve, and control temporary access:

- Review Temporary delegation requests – Monitor the status of your access requests, and view detailed information about requests to approve or deny temporary delegation requests.
- Revoke temporary delegation access – Immediately terminate active temporary delegation sessions before they expire naturally.

Review Temporary delegation requests

After initiating a temporary delegation request, you can monitor, approve, and reject requests in the IAM console. The Temporary delegation requests page provides a centralized view of all requests, including those that are pending approval, completed, or rejected. As an administrator, you can review these requests to grant product providers access to AWS resources or reject them based on your organization's security policies, business requirements, or compliance standards. This visibility helps you track the lifecycle of product provider access and maintain oversight of temporary permissions.

> **Note**
>
> You must have the iam:AcceptDelegationRequest permission to approve temporary delegation requests.

To approve a temporary delegation request

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left, choose *Temporary delegation requests*.
3. The main page displays a list of your temporary delegation requests with the following information:
   - *Request ID* – Unique identifier for the request
   - *Status* – Current status (Pending, Approved, Rejected, Shared, Expired)
   - *Requestor* - Product provider associated with the request
   - *Initiated by* - IAM principal in the account who initiated the request for the product provider
   - *Request created*– When the request was submitted
   - *Request expires* – When the request expired or will expire
4. (Optional) Use the filter options to view requests by status:
   - *All requests* – View all your requests regardless of status
   - *Pending* – View requests awaiting administrator approval
   - *Approved* – View approved requests
   - *Shared* – View requests for which access has been shared
   - *Rejected* – View rejected requests with rejection reasons
5. To view detailed information about a specific request or to review a pending request for approval, choose the request ID.
6. Review the detailed request information:
   - Product provider information
   - Request reason and justification
   - Requested duration
   - Requested AWS permissions

7. If you are an administrator reviewing a pending request, choose one of the following options:

   - To approve the request, choose *Approve*. In the approval dialog, you can view the results of the permission simulation. For more information, see Permission simulation beta capability. After confirming access duration and your AWS identity, choose *Approve* to grant access. If the product provider requested immediate access, they automatically receive temporary permissions and the access duration begins. Otherwise, notify the person who initiated the request to release access to the product provider.
   - To reject the request, choose *Reject*.
     - In the rejection dialog, provide a clear reason for the rejection to help the requester understand why their request was denied.
     - Choose *Reject* to deny access.
8. The request list automatically refreshes to show the most current status information. You can also manually refresh the page to check for status updates.

Revoke Temporary delegation access

Although product provider access sessions are designed to expire automatically after their approved duration, you may need to terminate access immediately in certain situations. Revoking active product provider access provides an emergency control mechanism when security concerns arise, when the product provider's work is completed early, or when business requirements change. Both request initiators and administrators can revoke access to maintain security and operational control.

To revoke temporary delegation access

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left, choose *Temporary delegation requests*.
3. Locate the request ID for the access session you want to revoke.
4. Choose *Actions* and then choose *Revoke access*.
5. In the dialog, choose *Revoke access* to confirm that you want to immediately terminate the access session.

After revoking access, the product provider will no longer be able to access your AWS resources. The revocation is logged in AWS CloudTrail for audit purposes.

> **Important**
>
> Revoking access immediately terminates the product provider access session. Any ongoing work or processes using the access will be interrupted. Ensure that revocation won't disrupt critical operations.

> **Note**
>
> You cannot revoke access for requests that were approved using a root user. AWS recommends that you avoid using a root user to approve delegation requests. Use an IAM role with appropriate permissions instead.

Managing Permissions for Delegation Requests

Administrators can grant IAM principals permissions to manage delegation requests from product providers. This is useful when you want to delegate approval authority to specific users or teams in your organization, or when you need to control who can perform specific actions on delegation requests.

The following IAM permissions are available for managing delegation requests:

Permission	Description
iam:AssociateDelegationRequest	Associate an unassigned delegation request with your AWS account
iam:GetDelegationRequest	View details of a delegation request
iam:UpdateDelegationRequest	Forward a delegation request to an administrator for approval
iam:AcceptDelegationRequest	Approve a delegation request

Permission	Description
iam:SendDelegationToken	Release the exchange token to the product provider after approval
iam:RejectDelegationRequest	Reject a delegation request
iam:ListDelegationRequests	List delegation requests for your account

Note

By default, IAM principals who initiate a delegation request are automatically granted permissions to manage that specific request. They can associate it with their account, view request details, reject a request, forward it to an administrator for approval, release the exchange token to the product provider after admin approval, and list delegation requests that they own.

Notifications

IAM temporary delegation integrates with AWS User Notifications to help you stay informed about delegation request state changes. Notifications are particularly useful for administrators who need to review and approve delegation requests.

With AWS User Notifications, you can configure alerts to be delivered through multiple channels, including email, Amazon Simple Notification Service (SNS), AWS Chatbot for Slack or Microsoft Teams, and AWS Console Mobile Application. This ensures that the right people are notified at the right time, enabling faster response to pending approvals or awareness of access changes. You can also customize which events trigger notifications based on your organization's needs and security requirements.

Available Notification Events

You can subscribe to receive notifications for the following IAM temporary delegation events:

- IAM Temporary Delegation Request Created

- IAM Temporary Delegation Request Assigned
- IAM Temporary Delegation Request Pending Approval
- IAM Temporary Delegation Request Rejected
- IAM Temporary Delegation Request Accepted
- IAM Temporary Delegation Request Finalized
- IAM Temporary Delegation Request Expired

Configuring Notifications

To configure notifications for IAM temporary delegation events:

1. Open the AWS User Notifications console
2. Create or update a notification configuration
3. Select AWS IAM as the service
4. Choose which delegation request events you want to be notified about
5. Configure your delivery channels (email, AWS Chatbot, etc.)

For detailed instructions on configuring AWS User Notifications, including setting up delivery channels and managing notification rules, see the AWS User Notifications documentation.

CloudTrail

All actions performed by product providers using temporary delegated access are automatically logged in AWS CloudTrail. This provides complete visibility and auditability of product provider activity in your AWS account. You can identify which actions were taken by product providers, when they occurred, and which product provider account performed them.

To help you distinguish between actions taken by your own IAM principals and those taken by product providers with delegated access, CloudTrail events include a new field called `invokedByDelegate` under the `userIdentity` element. This field contains the AWS account ID of the product provider, making it easy to filter and audit all delegated actions.

CloudTrail Event Structure

The following example shows a CloudTrail event for an action performed by a product provider using temporary delegated access:

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE:Role-Session-Name",
        "arn": "arn:aws:sts::111122223333:assumed-role/Role-Name/Role-Session-Name",
        "accountId": "111122223333",
        "accessKeyId": "[REDACTED:AWS_ACCESS_KEY]",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AIDACKCEVSQ6C2EXAMPLE",
                "arn": "arn:aws:iam::111122223333:role/Admin",
                "accountId": "111122223333",
                "userName": "Admin"
            },
            "attributes": {
                "creationDate": "2024-09-09T17:50:16Z",
                "mfaAuthenticated": "false"
            }
        },
        "invokedByDelegate": {
            "accountId": "444455556666"
        }
    },
    "eventTime": "2024-09-09T17:51:44Z",
    "eventSource": "iam.amazonaws.com",
    "eventName": "GetUserPolicy",
    "awsRegion": "us-east-1",
    "requestParameters": {
        "userName": "ExampleIAMUserName",
        "policyName": "ExamplePolicyName"
    },
    "eventType": "AwsApiCall",
    "recipientAccountId": "111122223333"
}
```

The `invokedByDelegate` field contains the AWS account ID of the product provider who performed the action using delegated access. In this example, account 444455556666 (the product provider) performed an action in account 111122223333 (the customer account).

IAM temporary delegation for AWS Partners

Overview

IAM temporary delegation enables AWS customers to seamlessly onboard and/or integrate AWS Partner products into their AWS environment through interactive, guided workflows. Customers can grant AWS Partners limited, temporary access to configure required AWS services, reducing onboarding friction and accelerating time to value.

IAM temporary delegation enables partners to:

- Streamline customer onboarding with automated resource provisioning
- Reduce integration complexity by eliminating manual configuration steps
- Build trust through transparent, customer-approved permissions
- Enable ongoing operations with long-term access patterns using permission boundaries

How it works

1. *Partner creates a delegation request* - Partners create a request specifying what permissions they need and for how long
2. *Customer reviews in AWS Console* - Customer sees exactly what permissions partner is requesting and why
3. *Customer approves* - Customer approves the request and releases an exchange token. The token is sent to partner on this specified SNS topic.
4. *Partner receives temporary credentials* - Partners exchange the token for temporary AWS credentials
5. *Partner configures resources* - Partners use the credentials to set up required resources in the customer's account

Partner qualification

To qualify for temporary delegation integration, a partner must meet the following requirements:

- *ISV Accelerate participation* – You must be enrolled in the ISV Accelerate (ISVA) program.
- *AWS Marketplace listing* – Your product must be listed in the AWS Marketplace with a "Deployed on AWS" badge.

Onboarding process

Complete the following steps to integrate temporary delegation into your product:

1. *Step 1: Review requirements*

   Review this documentation to understand the qualification requirements and complete the partner questionnaire below.

2. *Step 2: Submit your onboarding request*

   Send an email to aws-iam-partner-onboarding@amazon.com or contact your AWS representative. Include your completed partner questionnaire with all required fields from the table below.

3. *Step 3: AWS validation and review*

   AWS will:

   - Validate that you meet the qualification criteria
   - Review your policy templates and permission boundaries
   - Provide feedback on your submitted artifacts

4. *Step 4: Refine your policies*

   Respond to AWS feedback and submit updated policy templates or permission boundaries as needed.

5. *Step 5: Complete registration*

   Once approved, AWS will:

   - Enable API access for your specified accounts
   - Share ARNs for your policy template and permissions boundary (if applicable)

   You will receive confirmation when onboarding is complete. You can then access temporary delegation APIs, CreateDelegationRequest and GetDelegatedAccessToken from your registered accounts and begin integrating delegation request workflows into your product.

Partner questionnaire

The following table lists the information required for partner onboarding:

Information	Description	Required
Partner Central AccountID	Account ID of your registered AWS account on AWS Partner Central.	Yes
PartnerId	Partner ID provided by AWS Partner Central.	No
AWS Marketplace Product Id	Product ID for your product provided by AWS Partner Central.	Yes
AWS accountIDs	The list of your AWS Account IDs that you want to use to call temporary delegation APIs. This should include both your production and non-production/test accounts.	Yes
Partner name	This name is displayed to customers in the AWS Management Console when they review your temporary delegation request.	Yes
Contact email(s)	One or more email addresses that we can use to contact you about your integration.	Yes
Requestor Domain	Your domain (for example, www.example.com)	Yes
Integration description	Brief description of the use case that you want to address using this feature. You can include reference links to your documentation or other public material.	Yes
Architecture diagram	Architecture diagram illustrating your integration use case(s).	No
Policy template	You must register at least one policy template for this feature. The policy template defines the temporary permissions you want to request in customers' AWS	Yes

Information	Description	Required
	accounts. For more information, see Policy template section.	
Policy template name	Name of the policy template you want to register.	Yes
Permissions Boundary	If you want to create IAM roles in customers' accounts using temporary permissions, you must register a permission boundary with IAM. Permission boundaries will be attached to the IAM roles that you create to limit the maximum permissions on the role. You can use selected AWS managed policies as a permission boundary or register a new custom permission boundary (JSON). For more information, see Permissions Boundary section.	No
Permission Boundary Name	The name of your permission boundary. The format is: arn:aws:iam::partner:policy/permission_boundary/<partner_domain>/<policy_name>_<date> The policy name must include the creation date as a suffix. The name cannot be updated once the permission boundary is created. If you are using an existing AWS managed policy, provide the managed policy ARN instead.	No
Permission Boundary Description	Description for the permission boundary. This description cannot be updated once the permission boundary is created.	No

Understanding your integration

After completing the onboarding process, you can build your integration with IAM temporary delegation. A complete integration typically involves three main categories of work:

1. User Experience and Workflow Design

Build a front-end experience in the partner application that guides customers through the temporary delegation workflow. Partner application should:

- Present a clear onboarding or configuration flow where customers can grant temporary access. Label this action clearly, such as "Deploy with IAM temporary delegation".
- Redirect customers to the AWS Management Console to review and approve the delegation request using the console link returned by the CreateDelegationRequest API
- Provide appropriate messaging about what permissions are being requested and why. Customers can see this message on the delegation request details page.
- Handle the customer's return to your application after they complete the approval in AWS.

2. API Integration

Use IAM temporary delegation APIs to send and manage delegation requests. Once your AWS accounts are registered, you can access the following APIs:

- *IAM CreateDelegationRequest* – Creates a delegation request for a customer's AWS account. This API returns a console link that you redirect customers to for reviewing and approving the request.
- *AWS STS GetDelegatedAccessToken* – Retrieves temporary AWS credentials after a customer approves your delegation request. Use these credentials to perform actions in the customer's account.

Your integration should handle the complete lifecycle of delegation requests, including creating requests, monitoring their status, and retrieving temporary credentials when approved.

3. Resource Configuration and Orchestration

Once you obtain temporary credentials, orchestrate the necessary workflows to configure resources in the customer's AWS account. This may include:

- Calling AWS service APIs directly to create and configure resources
- Deploying infrastructure using AWS CloudFormation templates
- Creating IAM roles for ongoing access (requires using permission boundaries)

Your orchestration logic should be idempotent and handle failures gracefully, as customers may need to retry or modify their delegation approvals.

Understanding permissions

As part of the feature onboarding process, you will need to register policies with IAM that define the permissions you want to request in customers' AWS accounts. The registration process provides a more consistent experience for customers and helps avoid common pitfalls in policy authoring.

During registration, AWS evaluates your policies against a set of validations. These validations are intended to standardize policy formatting and structure, and provide basic protections against known anti-patterns. The validations also reduce the risk of privilege escalations, unintended cross-account access, and broad access to high-value resources in customer accounts.

Permission Types

AWS will consider two categories of permissions: temporary and long-term.

Temporary Permissions

Temporary permissions limit the permissions assigned to any temporary delegated access sessions. Temporary permissions are described in policy templates that are applied to the delegated session. The templates support parameters that you supply when you create a delegation request. These parameter values are then bound to the session. The temporary permissions work in the same way as the session policies available in AWS STS today: the policies limit the capability of the underlying user, but do not grant any additional access. For more information, see the AWS STS documentation on session policies.

Long-Term Permissions

Long-term permissions limit the permissions of any roles that are created or managed via temporary access. Long-term permissions are implemented as IAM permissions boundaries. You may submit one or more permission boundaries to AWS as part of onboarding. Once approved, AWS will share a policy ARN with you that you can reference in your policies.

These boundary policies have two noteworthy features. First, they are immutable. If you want to update permissions, you can register a new permissions boundary. You can then attach the new permissions boundary to your customers' roles by sending a new delegation request. Second, the policies are not templated. Since the same boundary policy is globally shared, they cannot be altered on a per-customer basis.

Important

Permission boundaries have a maximum size limit of 6,144 characters.

Note

If you would like to update a permission boundary or policy template, contact IAM at aws-iam-partner-onboarding@amazon.com. Once the new permission boundary is registered, you can then send a delegation request to customers to update the IAM role and attach the newly registered permission boundary. See the Examples section for more details.

Example Use Case: Data Processing Workload

Consider a product provider that runs a data processing workload in customer accounts. The provider needs to set up infrastructure during initial onboarding, but also requires ongoing access to operate the workload.

Temporary permissions (for initial setup):

- Create Amazon EC2 instances, VPC, and security groups
- Create an Amazon S3 bucket for processed data
- Create an IAM role for ongoing operations
- Attach a permission boundary to the IAM role

Long-term permissions (IAM role with permission boundary for ongoing operations):

- Start and stop Amazon EC2 instances to run processing jobs
- Read input data from Amazon S3 bucket
- Write processed results to Amazon S3 bucket

The temporary permissions are used once during onboarding to configure the infrastructure. The IAM role created during this process has a permission boundary that limits its maximum permissions to only the operations needed for ongoing workload management. This ensures that even if the role's policies are modified, it cannot exceed the permissions defined in the boundary.

Policy evaluation guidelines

AWS will evaluate your submitted policies against a set of guidelines. The same evaluation guidelines apply to both policy templates and permission boundaries, with minor differences noted where appropriate.

For the purposes of evaluation, we separate services into distinct groups. The most important distinction is for security-sensitive services, which manage access, credentials, and keys. Policies granting access to these services need to be focused narrowly on the work being done. Security-sensitive services include the following: AWS Identity and Access Management (IAM), AWS Key Management Service (KMS), AWS Resource Access Manager (RAM), AWS IAM Identity Center, AWS Organizations, and AWS Secrets Manager.

A secondary distinction is services that can access data across account boundaries. Policies for these services must include protections to prevent unintentional cross-account access.

Common validations

All policy statements must follow these guidelines:

- All statements must include Effect, Action (or NotAction), Resource, and Condition fields in that order
- All actions within a single statement must be listed alphabetically
- All ARNs included in the policy must follow the syntax defined in public documentation for the relevant services
- NotAction fields can only be used in Deny statements
- Actions in Allow statements must include a service code. Generic wildcards ("*") are not allowed

Security-sensitive service restrictions

The following restrictions apply to security-sensitive services mentioned above:

- Actions in Allow statements must be more specific than [service]:*
- Actions in Allow statements for temporary access policy templates must not contain wildcards
- Sensitive actions, such as iam:PassRole or iam:CreateServiceLinkedRole, require additional scoping, such as specific resources or conditional checks. These actions include:
  - IAM role passing

  - IAM role modification actions
  - IAM policy modification actions
  - AWS KMS write or cryptographic operations
  - AWS RAM write or share operations
  - AWS Secrets Manager operations for retrieving or modifying secrets, or modifying resource policies
- Other actions may use a wildcard resource, such as iam:ListUsers or iam:GetPolicy
- Actions that manage credentials, such as iam:CreateAccessKey, are blocked

IAM-specific restrictions

For IAM:

- Only limited write operations are allowed for IAM roles and policies. You can not request permissions on other IAM resources such as users, groups, and certificates.
- Policy attachment or inline policy management actions are limited to roles with a permission boundary. Permission boundaries must be partner-supplied or on a list of allowed AWS managed policies. AWS managed policies may be allowed if they do not grant highly privileged or administrative permissions. For example, AWS managed policies for specific job functions or the SecurityAudit policy may be acceptable. AWS will review each AWS managed policy on a case-by-case basis during the onboarding process.
- Policy management is only allowed for policies with a partner-specific path: arn:aws:iam::@{AccountId}:policy/partner_domain.com/[feature]*
- Tags may only be applied during resource creation, and only for roles and policies
- iam:PassRole checks must match a specific name or path prefix

AWS STS-specific restrictions

For AWS STS:

- sts:AssumeRole must be scoped to a specific role ARN, role ARN prefix, or limited to a set of accounts or organization ID/organizational unit

IAM Identity Center restrictions

For AWS IAM Identity Center, the following actions are blocked:

- All actions dealing with permissions management (e.g., sso:AttachCustomerManagedPolicyReferenceToPermissionSet)
- User, group, and membership modifications for AWS Identity Store
- Tag management

AWS Organizations restrictions

For AWS Organizations, only read actions will be allowed.

Additional service-specific validations

- Actions that acquire secrets or credentials, such as glue:GetConnection or redshift:GetClusterCredentials, must have conditions matching either full ARNs, ARN prefixes, or tags
- For Amazon Redshift: redshift:GetClusterCredentials is only allowed on a specific database name, and redshift:GetClusterCredentialsWithIAM is only allowed on a specific workgroup name

> **Note**
>
> When managing IAM resources in the account, we recommend using a path that indicates your name, e.g., arn:aws:iam::111122223333:role/partner.com/rolename. This will help differentiate the resources associated with your integration and make discovery, audit, and analysis easier for customers.

Cross-account access requirements

Statements that potentially allow cross-account access must include at least one of the following:

- A condition specifying the account or organization for the resource (e.g., aws:ResourceOrgId matching one or more expected values)
- A Resource field that includes a specific account (e.g., arn:aws:sqs:*:111122223333:*)

- A Resource field that includes a non-wildcard account and a full resource name (e.g., arn:aws:s3:::full-bucket-name)

> **Note**
>
> Cross-account access is a sensitive capability that requires clear business justification. AWS will carefully review the need for cross-account access during the onboarding process.

Policy templates

Policy templates are a new IAM construct designed for defining temporary permissions that partners request in customers' accounts. Like regular IAM policies, they define permissions using statements with Effect, Action, Resource, and Condition elements. The key difference is that policy templates include parameters (such as @{bucketName}) that are replaced with actual values when you create a delegation request.

How Policy Templates Work

As part of the onboarding process, you register your policy templates with AWS. AWS assigns each template a unique ARN that you reference when creating delegation requests.

When you create a delegation request, you specify:

- The policy template ARN
- Parameter values to substitute into the template

AWS combines the template with your parameter values to generate a standard IAM policy. Customers review this final rendered policy when approving your delegation request, seeing exactly what permissions will be granted.

> **Note**
>
> The final rendered policy has a maximum size limit of 2048 characters.

Here's a simple example showing how template substitution works.

Policy Template:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::@{bucketName}/*"
        }
    ]
}
```

Parameters Provided in Delegation Request:

```
{
    "Name": "bucketName",
    "Values": ["customer-data-bucket"],
    "Type": "String"
}
```

Final rendered policy (what customers see):

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::customer-data-bucket/*"
        }
    ]
}
```

Template Syntax

Policy templates use two key features to provide flexibility: parameter substitution and conditional statements. Parameter substitution allows you to define placeholders in your template that are

replaced with actual values when creating a delegation request. Conditional statements allow you to include or exclude entire policy statements based on parameter values.

Parameter Substitution and Types

Use the @{parameterName} syntax to define parameters in your policy template. When creating a delegation request, you must specify the type for each parameter.

String

A single value that is substituted directly into the template.

Template:

```
"Resource": "arn:aws:s3:::@{bucketName}/*"
```

Parameters:

```
{
    "Name": "bucketName",
    "Values": ["my-bucket"],
    "Type": "String"
}
```

Rendered result:

```
"Resource": "arn:aws:s3:::my-bucket/*"
```

StringList

Multiple values that generate multiple resource entries. When a StringList parameter is used in a resource ARN, it expands to create separate resource entries for each value.

Template:

```
"Resource": "arn:aws:s3:::@{bucketNames}/*"
```

Parameters:

```
{
    "Name": "bucketNames",
```

```
    "Values": ["bucket-1", "bucket-2"],
    "Type": "StringList"
}
```

Rendered result:

```
"Resource": [
    "arn:aws:s3:::bucket-1/*",
    "arn:aws:s3:::bucket-2/*"
]
```

Cross-Product Behavior

When multiple parameters are used in the same resource ARN, StringList parameters create a cross-product of all combinations.

Template:

```
"Resource": "arn:aws:s3:::@{bucketNames}/@{prefix}/*"
```

Parameters:

```
[
    {
        "Name": "bucketNames",
        "Values": ["bucket-1", "bucket-2"],
        "Type": "StringList"
    },
    {
        "Name": "prefix",
        "Values": ["data"],
        "Type": "String"
    }
]
```

Rendered result:

```
"Resource": [
    "arn:aws:s3:::bucket-1/data/*",
    "arn:aws:s3:::bucket-2/data/*"
]
```

Conditional Statements

Use the @Enabled directive to conditionally include or exclude entire statements based on parameter values.

Syntax:

- @Enabled: "parameterName" - Include the statement when parameter value is "True"
- @Enabled: "!parameterName" - Include the statement when parameter value is NOT "True" (negation)

Template:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        },
        {
            "@Enabled": "ENABLE_S3_WRITE",
            "Effect": "Allow",
            "Action": ["s3:PutObject"],
            "Resource": "arn:aws:s3:::@{bucketName}/*"
        }
    ]
}
```

Parameters (when ENABLE_S3_WRITE is "True"):

```
[
    {
        "Name": "bucketName",
        "Values": ["my-bucket"],
        "Type": "String"
    },
    {
        "Name": "ENABLE_S3_WRITE",
        "Values": ["True"],
        "Type": "String"
```

```
    }
]
```

Rendered result:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": ["s3:PutObject"],
            "Resource": "arn:aws:s3:::my-bucket/*"
        }
    ]
}
```

Parameters (when ENABLE_S3_WRITE is "False"):

```
[
    {
        "Name": "bucketName",
        "Values": ["my-bucket"],
        "Type": "String"
    },
    {
        "Name": "ENABLE_S3_WRITE",
        "Values": ["False"],
        "Type": "String"
    }
]
```

Rendered result:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

```
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": "*"
        }
    ]
}
```

When ENABLE_S3_WRITE is set to "True", the conditional statement is included. When set to "False", the statement is excluded from the rendered policy.

Additional Examples

The following examples demonstrate common patterns for using policy templates in temporary delegation. They focus on creating IAM roles with permission boundaries for long-term access and show different strategies for scoping permissions to specific resources. These examples illustrate how to balance flexibility with security by using techniques such as ARN prefixes, resource tagging, and permission boundary updates.

Example 1: Granting Long-Term Access to Specific Resources

The following permission boundary is submitted as "SQSAccessorBoundary" for "partner.com":

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
}
```

> **Note**
>
> This includes a same-account condition to avoid granting access to queues in other accounts with open resource policies. A direct reference to the customer's account ID

cannot be included because the boundary is shared across all customers and cannot be templated.

Since this is the first version of this policy, its ARN is arn:aws:iam::partner:policy/partner.com/SQSAccessorBoundary_20250115

The following policy template is submitted for temporary access permissions:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sqs:ListQueues"
            ],
            "Resource": "arn:aws:sqs:*:*:*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateRole",
                "iam:PutRolePermissionsBoundary",
                "iam:PutRolePolicy"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
partner.com/SQSAccessorBoundary_20250115"
                }
            }
        }
    ]
}
```

Example 2: Using ARN Prefixes

The permission boundary can specify a resource ARN prefix to limit access:

```
"Resource": "arn:aws:sqs:*:@{AccountId}:PartnerPrefix*"
```

This limits access to only the resources with that prefix, reducing the scope of accessible resources.

Example 3: Using Tags for Resource Access Control

You can tag resources during temporary delegated access and rely on those tags for long-term access control.

Permission boundary allowing access to tagged resources:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "Null": {
            "aws:ResourceTag/ManagedByPartnerDotCom": "false"
        },
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
}
```

Policy template to tag new queues on creation:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:CreateQueue",
        "sqs:TagQueue"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "Null": {
            "aws:RequestTag/ManagedByPartnerDotCom": "false"
        }
    }
}
```

Policy template to tag pre-existing queues and create the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sqs:TagQueue"
            ],
            "Resource": "arn:aws:sqs:*:@{AccountId}:@{QueueName}",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "ManagedByPartnerDotCom"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateRole",
                "iam:PutRolePermissionsBoundary",
                "iam:PutRolePolicy"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
partner.com/SQSAccessorBoundary_20250115"
                }
            }
        }
    ]
}
```

This approach allows customers to explicitly confirm which specific resources can be accessed long-term.

Example 4: Updating the Permission Boundary

To update a permission boundary, register a new version with a new date suffix and request permission to replace it.

Updated permission boundary with additional permission:

```
{
    "Effect": "Allow",
    "Action": [
        "sqs:DeleteMessage",
        "sqs:PurgeQueue",
        "sqs:ReceiveMessage",
        "sqs:SendMessage"
    ],
    "Resource": "arn:aws:sqs:*:*:*",
    "Condition": {
        "StringEquals": {
            "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
    }
}
```

As the second version, this policy has the ARN: arn:aws:iam::partner:policy/partner.com/SQSAccessorBoundary_2025_01_20

Policy template to update the permission boundary on the existing role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iam:PutRolePermissionsBoundary"
            ],
            "Resource": "arn:aws:iam::@{AccountId}:role/partner.com/SQSAccessor",
            "Condition": {
                "StringEquals": {
                    "iam:PermissionsBoundary": "arn:aws:iam::partner:policy/
partner.com/SQSAccessorBoundary_2025_01_20"
                }
            }
        }
    ]
}
```

Customers must approve this delegation request to update the permission boundary on the existing role.

Building your integration

Understanding the Request Lifecycle

Before building your integration, it's important to understand how delegation requests progress from creation to completion.

Request States

A delegation request progresses through the following states:

State	Description
Unassigned	Request created but not yet associated with a customer account and an IAM principal. The request may have been created without specifying a target account, or with a target account ID but not yet claimed by the account owner.
Assigned	Request associated with a customer account and awaiting review
Pending Approval	Customer has forwarded the request to an administrator for approval
Accepted	Request approved by customer but exchange token not yet released
Finalized	Exchange token released to product provider. The delegation period (exchange token validity) begins when the request reaches Finalized state
Rejected	Request rejected by customer
Expired	Request expired due to inactivity or timeout

State Transitions

Normal Flow (Approval Path)

- Unassigned → Assigned: Customer associates the request with their account

- Assigned → Accepted OR Assigned → Pending Approval: Customer approves the request directly OR forwards to administrator for review
- Pending Approval → Accepted: Administrator approves the request
- Accepted → Finalized: Customer releases the exchange token

Rejection Path

- Assigned → Rejected: Customer rejects the request
- Pending Approval → Rejected: Administrator rejects the request
- Accepted → Rejected: Customer revokes approval before releasing token

Expiration Path

Requests automatically expire if no action is taken within the specified timeframe:

- Unassigned → Expired (1 day)
- Assigned → Expired (7 days)
- Pending Approval → Expired (7 days)
- Accepted → Expired (7 days)
- Rejected → Expired (7 days)
- Finalized → Expired (7 days)

Terminal States

The following states are terminal (no further transitions):

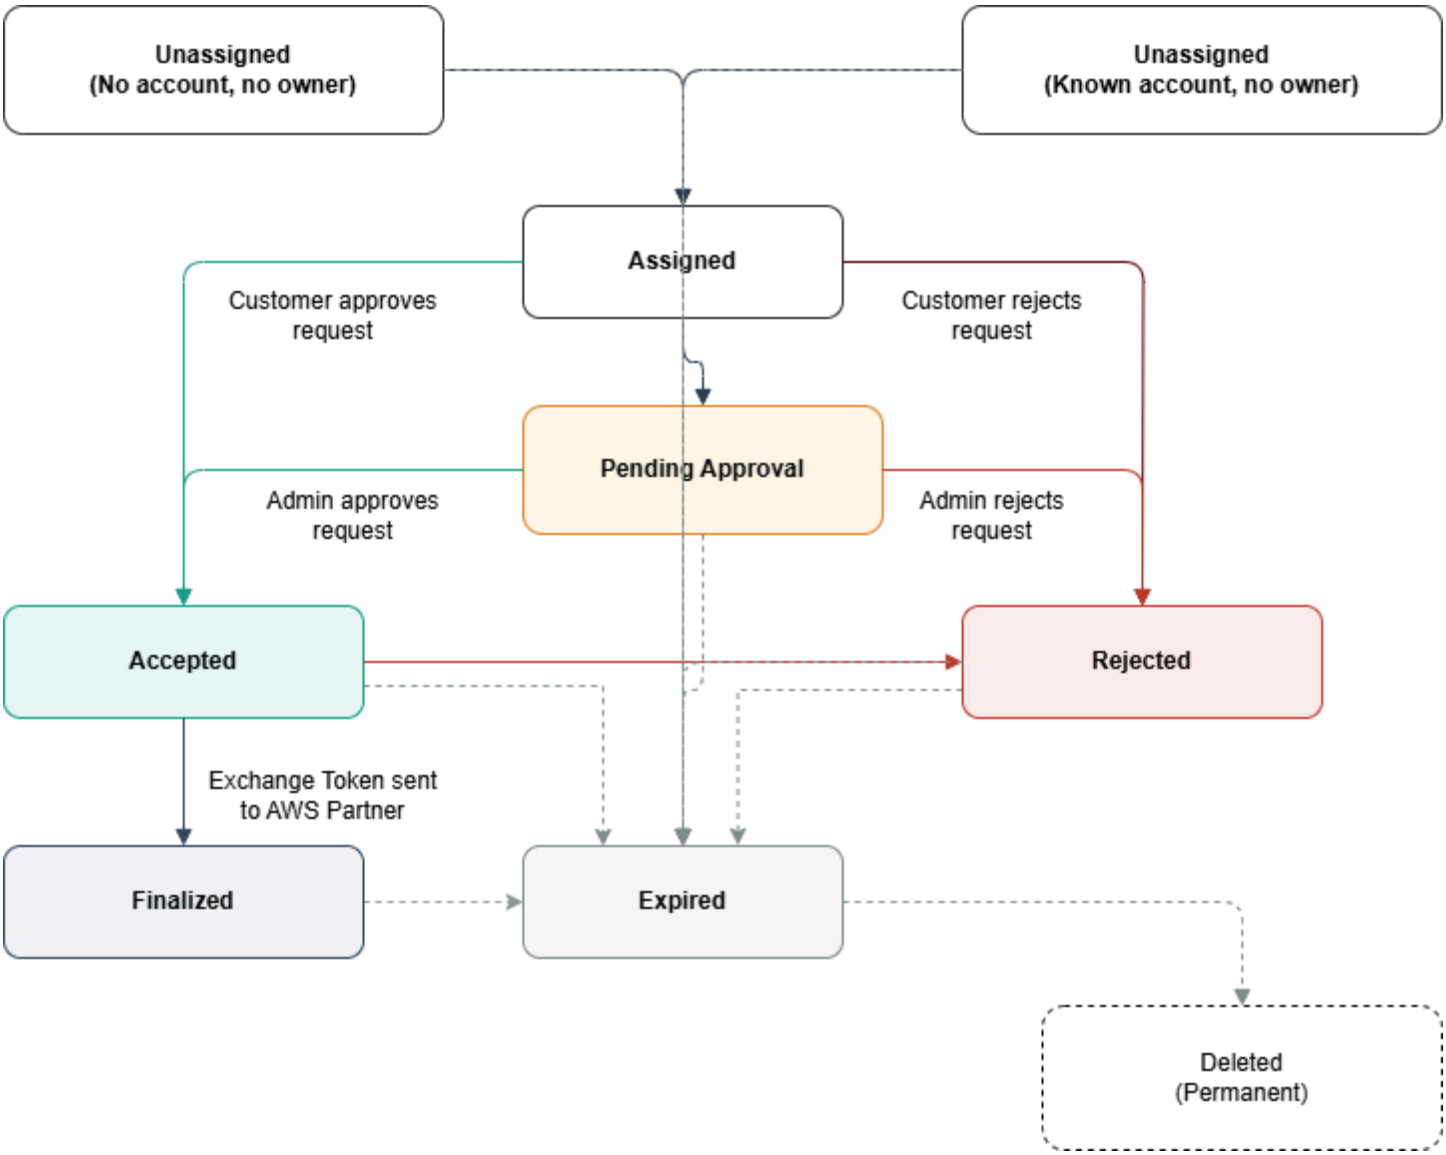
- Finalized: Exchange Token sent
- Rejected: Request was denied
- Expired: Request timed out or delegation period ended

Expired requests are eventually deleted from the system after the retention period.

Managing delegation request states in your application

As a partner, you must track delegation request states in your system and surface them to your customers. When you receive SNS notifications about state changes, store these updates in

your backend and reflect them in your customer-facing UI. Pay special attention to the Pending Approval state—when a customer forwards a request to an administrator for review, AWS sends a Pending Approval notification to you. Requests can remain in this state for up to 7 days while waiting for administrator action. During this time, show customers that their request is pending administrator approval in your application. Consider providing a deep link to the AWS Console where customers can check the request status or follow up with their administrator. Properly handling the state machine in your backend and surfacing the correct state information to customers at each stage is important for a good integration experience.



Configuring Notifications

IAM uses Amazon Simple Notification Service (SNS) to communicate delegation request state changes to you. When you create a delegation request, you must provide an SNS topic ARN

from your registered AWS account. IAM will publish messages to this topic for important events, including when customers approve or reject requests and when the exchange token is ready.

> **Note**
>
> SNS topics cannot be in opt-in AWS Regions. Your SNS topic must be in an AWS Region that is enabled by default. For a list of opt-in Regions, see Managing AWS Regions in the AWS Account Management guide.

SNS Topic Configuration

To receive delegation request notifications, you must configure your SNS topic to grant IAM permissions to publish messages to it. Add the following policy statement to your SNS topic policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowIAMServiceToPublish",
            "Effect": "Allow",
            "Principal": {
                "Service": "iam.amazonaws.com"
            },
            "Action": "SNS:Publish",
            "Resource": "arn:aws:sns:REGION:ACCOUNT-ID:TOPIC-NAME"
        }
    ]
}
```

> **Important**
>
> The SNS topic must be in one of your registered AWS accounts. IAM will not accept SNS topics from other accounts. If the topic policy is not correctly configured, you will not receive state change notifications or the exchange token.

Notification Types

IAM sends two types of notifications:

StateChange Notifications

Sent when a delegation request transitions to a new state (Assigned, Pending Approval, Accepted, Finalized, Rejected, Expired).

ExchangeToken Notifications

Sent when a customer releases the delegation token (state Finalized). This notification includes the exchange token you need to obtain credentials.

Notification States

You will receive notifications for the following delegation request states:

State	Notification Type	Description
ASSIGNED	StateChange	Request has been associated with a customer account
PENDING APPROVAL	StateChange	Customer has forwarded the request to an administrator for approval
ACCEPTED	StateChange	Customer has approved the request but not yet released the token
FINALIZED	StateChange	Customer has released the exchange token
FINALIZED	ExchangeToken	This notification contains the Exchange Token
REJECTED	StateChange	Customer has rejected the request
EXPIRED	StateChange	Request expired before completion

Notification Message Format

IAM publishes standard SNS notifications. The delegation request information is contained in the Message field as a JSON string.

Common Fields (All Notifications)

Field	Type	Description
Type	String	Either "StateChange" or "ExchangeToken"
RequestId	String	The IAM delegation request ID
Requestor WorkflowId	String	The workflow ID you provided when creating the request
State	String	Current state of the request
OwnerAccountId	String	Customer's AWS account ID
UpdatedAt	String	Timestamp when the state changed (ISO 8601 format)

Additional Fields (ExchangeToken Notifications Only)

Field	Type	Description
ExchangeToken	String	The token to exchange for credentials using AWS STS GetDelegatedAccessToken API
ExpiresAt	String	When the delegated access expires (ISO 8601 format)

Example Notifications

StateChange Notification

```
{
  "Type": "Notification",
  "MessageId": "61ee8ad4-6eec-56b5-8f3d-eba57556aa13",
  "TopicArn": "arn:aws:sns:us-east-1:123456789012:partner-notifications",
  "Message": "{\"RequestorWorkflowId\":\"workflow-12345\",\"Type\":\"StateChange\",
\"RequestId\":\"dr-abc123\",\"State\":\"ACCEPTED\",\"OwnerAccountId\":\"111122223333\",
\"UpdatedAt\":\"2025-01-15T10:30:00.123Z\"}",
  "Timestamp": "2025-01-15T10:30:00.456Z",
  "SignatureVersion": "1",
  "Signature": "...",
  "SigningCertURL": "...",
```

```
  "UnsubscribeURL": "..."
}
```

ExchangeToken Notification

```
{
  "Type": "Notification",
  "MessageId": "e44e5435-c72c-5333-aba3-354406782f5b",
  "TopicArn": "arn:aws:sns:us-east-1:123456789012:partner-notifications",
  "Message": "{\"RequestId\":\"dr-abc123\",\"RequestorWorkflowId\":\"workflow-12345\",
\"State\":\"FINALIZED\",\"OwnerAccountId\":\"111122223333\",\"ExchangeToken\":
\"eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9...\",\"ExpiresAt\":\"2025-01-15T18:30:00.123Z\",
\"UpdatedAt\":\"2025-01-15T10:30:00.456Z\",\"Type\":\"ExchangeToken\"}",
  "Timestamp": "2025-01-15T10:30:00.789Z",
  "SignatureVersion": "1",
  "Signature": "...",
  "SigningCertURL": "...",
  "UnsubscribeURL": "..."
}
```

Exchange Tokens

An exchange token or a trade in token is issued by IAM when a customer accepts and finalizes a delegation request. The product provider uses this exchange or trade in token to call the AWS AWS STS GetDelegatedAccessToken API to obtain temporary AWS credentials with the permissions customers approved. The exchange token itself does not grant access to your AWS resources; it must be exchanged for actual credentials through AWS STS.

The exchange token can only be redeemed by the product provider account that created the delegation request. The requesting account is embedded in the token, ensuring that only the authorized product provider can obtain credentials to access customer account.

Access Duration

The delegation period starts when customer releases the exchange token, not when the product provider redeems it. Once customer releases the token:

- The product provider receives the token via SNS notification
- They can immediately exchange it for credentials
- Credentials expire at: release time + approved duration

- The product provider can exchange the token multiple times before expiration to obtain fresh credentials if needed

Multiple Redemptions

Product providers can exchange the token multiple times during the validity period to obtain fresh credentials. However, all credentials obtained from the same exchange token expire at the same time, based on when you released the token.

Example: If you approve a 2-hour delegation request and release the token at 10:00 AM:

Token Release Time	Token Exchange Time	Credential Expiry	Usable Time
10:00 am	10:00 am	12:00 pm	2 hours
10:00 am	10:20 am	12:00 pm	1 hour 40 minutes
10:00 am	11:40 am	12:00 pm	20 minutes
10:00 am	12:10 pm	Failed (token expired)	0 minutes

As shown in the table, exchanging the token later in the validity period results in less usable time for the product provider.

Code examples for IAM using AWS SDKs

The following code examples show how to use IAM with an AWS software development kit (SDK).

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Code examples for IAM using AWS SDKs

The following code examples show how to use IAM with an AWS software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Get started

Hello IAM

The following code examples show how to get started using IAM.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
namespace IAMActions;

public class HelloIAM
{
    static async Task Main(string[] args)
    {
        // Getting started with AWS Identity and Access Management (IAM). List
        // the policies for the account.
        var iamClient = new AmazonIdentityManagementServiceClient();

        var listPoliciesPaginator = iamClient.Paginators.ListPolicies(new
 ListPoliciesRequest());
        var policies = new List<ManagedPolicy>();

        await foreach (var response in listPoliciesPaginator.Responses)
        {
            policies.AddRange(response.Policies);
        }

        Console.WriteLine("Here are the policies defined for your account:\n");
        policies.ForEach(policy =>
        {
```

```
            Console.WriteLine($"Created:
 {policy.CreateDate}\t{policy.PolicyName}\t{policy.Description}");
        });
    }
}
```

- For API details, see ListPolicies in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS iam)

# Set this project's name.
project("hello_iam")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
 libraries for the AWS SDK.
    string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
 "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
```

```
    list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)
    # Copy relevant AWS SDK for C++ libraries into the current binary directory
 for running and debugging.

    # set(BIN_SUB_DIR "/Debug") # if you are building from the command line you
 may need to uncomment this
    # and set the proper subdirectory to the executables' location.

    AWSSDK_CPY_DYN_LIBS(SERVICE_COMPONENTS ""
 ${CMAKE_CURRENT_BINARY_DIR}${BIN_SUB_DIR})
endif ()

add_executable(${PROJECT_NAME}
        hello_iam.cpp)

target_link_libraries(${PROJECT_NAME}
        ${AWSSDK_LINK_LIBRARIES})
```

Code for the iam.cpp source file.

```
#include <aws/core/Aws.h>
#include <aws/iam/IAMClient.h>
#include <aws/iam/model/ListPoliciesRequest.h>
#include <iostream>
#include <iomanip>

/*
 *  A "Hello IAM" starter application which initializes an AWS Identity and
 Access Management (IAM) client
 *  and lists the IAM policies.
 *
 *  main function
 *
 *  Usage: 'hello_iam'
 *
 */
```

```
int main(int argc, char **argv) {
    Aws::SDKOptions options;
    // Optionally change the log level for debugging.
//   options.loggingOptions.logLevel = Utils::Logging::LogLevel::Debug;
    Aws::InitAPI(options); // Should only be called once.
    int result = 0;
    {

Hello IAM

The following code examples show how to get started using IAM.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
namespace IAMActions;

public class HelloIAM
{
    static async Task Main(string[] args)
    {
        // Getting started with AWS Identity and Access Management (IAM). List
        // the policies for the account.
```

```
        var iamClient = new AmazonIdentityManagementServiceClient();

        var listPoliciesPaginator = iamClient.Paginators.ListPolicies(new
 ListPoliciesRequest());
        var policies = new List<ManagedPolicy>();

        await foreach (var response in listPoliciesPaginator.Responses)
        {
            policies.AddRange(response.Policies);
        }

        Console.WriteLine("Here are the policies defined for your account:\n");
        policies.ForEach(policy =>
        {
            Console.WriteLine($"Created:
 {policy.CreateDate}\t{policy.PolicyName}\t{policy.Description}");
        });
    }
}
```

- For API details, see ListPolicies in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS iam)
```

```
# Set this project's name.
project("hello_iam")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
 libraries for the AWS SDK.
    string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
 "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Learn the basics of IAM with an AWS SDK

The following code examples show how to create a user and assume a role.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that wrap IAM user actions.

```
/*
  To run this Java V2 code example, set up your development environment,
 including your credentials.

  For information, see this documentation topic:

  https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html

  This example performs these operations:

  1. Creates a user that has no permissions.
  2. Creates a role and policy that grants Amazon S3 permissions.
  3. Creates a role.
  4. Grants the user permissions.
  5. Gets temporary credentials by assuming the role.  Creates an Amazon S3
 Service client object with the temporary credentials.
  6. Deletes the resources.
 */

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
import {
  CreateUserCommand,
  GetUserCommand,
  CreateAccessKeyCommand,
  CreatePolicyCommand,
  CreateRoleCommand,
  AttachRolePolicyCommand,
  DeleteAccessKeyCommand,
  DeleteUserCommand,
  DeleteRoleCommand,
  DeletePolicyCommand,
  DetachRolePolicyCommand,
  IAMClient,
} from "@aws-sdk/client-iam";
import { ListBucketsCommand, S3Client } from "@aws-sdk/client-s3";
import { AssumeRoleCommand, STSClient } from "@aws-sdk/client-sts";
import { retry } from "@aws-doc-sdk-examples/lib/utils/util-timers.js";
import { ScenarioInput } from "@aws-doc-sdk-examples/lib/scenario/index.js";

// Set the parameters.
const iamClient = new IAMClient({});
const userName = "iam_basic_test_username";
const policyName = "iam_basic_test_policy";
const roleName = "iam_basic_test_role";

/**
 * Create a new IAM user. If the user already exists, give
 * the option to delete and re-create it.
 * @param {string} name
 */
export const createUser = async (name, confirmAll = false) => {
  try {
    const { User } = await iamClient.send(
      new GetUserCommand({ UserName: name }),
    );
    const input = new ScenarioInput(
      "deleteUser",
      "Do you want to delete and remake this user?",
      { type: "confirm" },
```

```
    );
    const deleteUser = await input.handle({}, { confirmAll });
    // If the user exists, and you want to delete it, delete the user
    // and then create it again.
    if (deleteUser) {
      await iamClient.send(new DeleteUserCommand({ UserName: User.UserName }));
      await iamClient.send(new CreateUserCommand({ UserName: name }));
    } else {
      console.warn(
        `${name} already exists. The scenario may not work as expected.`,
      );
      return User;
    }
  } catch (caught) {
    // If there is no user by that name, create one.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
import json
import sys
import time
from uuid import uuid4

import boto3
from botocore.exceptions import ClientError

def progress_bar(seconds):
    """Shows a simple progress bar in the command window."""
    for _ in range(seconds):
        time.sleep(1)
        print(".", end="")
        sys.stdout.flush()
    print()

def setup(iam_resource):
    """
    Creates a new user with no permissions.
```

```
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM)
resource
                         that has permissions to create users, roles, and
policies
                         in the account.
    :return: The newly created user, user key, and role.
    """

Actions for IAM using AWS SDKs

The following code examples demonstrate how to perform individual IAM actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the IAM API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for IAM using AWS SDKs .

The following examples include only the most commonly used actions. For a complete list, see the AWS Identity and Access Management API Reference.

Examples

- Use AddClientIdToOpenIdConnectProvider with a CLI
- Use AddRoleToInstanceProfile with a CLI
- Use AddUserToGroup with a CLI
- Use AttachGroupPolicy with a CLI
- Use AttachRolePolicy with an AWS SDK or CLI
- Use AttachUserPolicy with an AWS SDK or CLI
- Use ChangePassword with a CLI
- Use CreateAccessKey with an AWS SDK or CLI
- Use CreateAccountAlias with an AWS SDK or CLI
- Use CreateGroup with an AWS SDK or CLI
- Use CreateInstanceProfile with an AWS SDK or CLI
- Use CreateLoginProfile with a CLI
- Use CreateOpenIdConnectProvider with a CLI
- Use CreatePolicy with an AWS SDK or CLI
- Use CreatePolicyVersion with an AWS SDK or CLI
- Use CreateRole with an AWS SDK or CLI
- Use CreateSAMLProvider with an AWS SDK or CLI
- Use CreateServiceLinkedRole with an AWS SDK or CLI
- Use CreateUser with an AWS SDK or CLI
- Use CreateVirtualMfaDevice with a CLI
- Use DeactivateMfaDevice with a CLI
- Use DeleteAccessKey with an AWS SDK or CLI
- Use DeleteAccountAlias with an AWS SDK or CLI

- Use DeleteAccountPasswordPolicy with a CLI
- Use DeleteGroup with an AWS SDK or CLI
- Use DeleteGroupPolicy with a CLI
- Use DeleteInstanceProfile with an AWS SDK or CLI
- Use DeleteLoginProfile with a CLI
- Use DeleteOpenIdConnectProvider with a CLI
- Use DeletePolicy with an AWS SDK or CLI
- Use DeletePolicyVersion with a CLI
- Use DeleteRole with an AWS SDK or CLI
- Use DeleteRolePermissionsBoundary with a CLI
- Use DeleteRolePolicy with an AWS SDK or CLI
- Use DeleteSAMLProvider with an AWS SDK or CLI
- Use DeleteServerCertificate with an AWS SDK or CLI
- Use DeleteServiceLinkedRole with an AWS SDK or CLI
- Use DeleteSigningCertificate with a CLI
- Use DeleteUser with an AWS SDK or CLI
- Use DeleteUserPermissionsBoundary with a CLI
- Use DeleteUserPolicy with an AWS SDK or CLI

Use `AddClientIdToOpenIdConnectProvider` with a CLI

The following code examples show how to use `AddClientIdToOpenIdConnectProvider`.

CLI

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
```

```
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the client ID (or audience) `my-application-ID` to the existing OIDC provider named `server.example.com`.

```
Add-IAMClientIDToOpenIDConnectProvider -ClientID "my-application-ID"
 -OpenIDConnectProviderARN "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
```

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the client ID (or audience) `my-application-ID` to the existing OIDC provider named `server.example.com`.

```
Add-IAMClientIDToOpenIDConnectProvider -ClientID "my-application-ID"
 -OpenIDConnectProviderARN "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
```

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use AddRoleToInstanceProfile with a CLI

The following code examples show how to use AddRoleToInstanceProfile.

CLI

AWS CLI

To add a role to an instance profile

The following add-role-to-instance-profile command adds the role named S3Access to the instance profile named Webserver.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the create-instance-profile command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see AddRoleToInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the role named S3Access to an existing instance profile named webserver. To create the instance profile, use the New-IAMInstanceProfile command. After you create the instance profile and associate it with a role using this command, you can attach it to an EC2 instance. To do that, use the New-EC2Instance cmdlet with either the InstanceProfile_Arn or the InstanceProfile-Name parameter to launch the new instance.

```
Add-IAMRoleToInstanceProfile -RoleName "S3Access" -InstanceProfileName
 "webserver"
```

- For API details, see AddRoleToInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the role named `S3Access` to an existing instance profile named `webserver`. To create the instance profile, use the `New-IAMInstanceProfile` command. After you create the instance profile and associate it with a role using this command, you can attach it to an EC2 instance. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or the `InstanceProfile-Name` parameter to launch the new instance.

```
Add-IAMRoleToInstanceProfile -RoleName "S3Access" -InstanceProfileName
 "webserver"
```

- For API details, see AddRoleToInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AddUserToGroup` with a CLI

The following code examples show how to use `AddUserToGroup`.

CLI

AWS CLI

To add a user to an IAM group

The following `add-user-to-group` command adds an IAM user named Bob to the IAM group named `Admins`.

```
aws iam add-user-to-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see AddUserToGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command adds the user named Bob to the group named Admins.

```
Add-IAMUserToGroup -UserName "Bob" -GroupName "Admins"
```

- For API details, see AddUserToGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command adds the user named Bob to the group named Admins.

```
Add-IAMUserToGroup -UserName "Bob" -GroupName "Admins"
```

- For API details, see AddUserToGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AttachGroupPolicy` with a CLI

The following code examples show how to use `AttachGroupPolicy`.

CLI

AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attaches the customer managed policy named `TesterPolicy` to the IAM group `Testers`. The users in that group are immediately affected by the permissions defined in the default version of that policy.

```
Register-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example attaches the AWS managed policy named `AdministratorAccess` to the IAM group `Admins`. The users in that group are immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMGroupPolicy -GroupName Admins -PolicyArn arn:aws:iam::aws:policy/
AdministratorAccess
```

- For API details, see AttachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attaches the customer managed policy named `TesterPolicy` to the IAM group `Testers`. The users in that group are immediately affected by the permissions defined in the default version of that policy.

```
Register-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example attaches the AWS managed policy named `AdministratorAccess` to the IAM group `Admins`. The users in that group are immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMGroupPolicy -GroupName Admins -PolicyArn arn:aws:iam::aws:policy/
AdministratorAccess
```

- For API details, see AttachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `AttachRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `AttachRolePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Manage roles
- Work with Streams and Time-to-Live

.NET

                  roleName << ": " << outcome.GetError().GetMessage() <<
 std::endl;
    }
    else {
        std::cout << "Successfully attached policy " << policyArn << " to role "
 <<
                  roleName << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see AttachRolePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachRolePolicy in *AWS CLI Command Reference*.

Use `AttachUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `AttachUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

CLI

AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attaches the AWS managed policy named `AmazonCognitoPowerUser` to the IAM user Bob. The user is immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::aws:policy/
AmazonCognitoPowerUser
```

- For API details, see AttachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attaches the AWS managed policy named `AmazonCognitoPowerUser` to the IAM user Bob. The user is immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::aws:policy/
AmazonCognitoPowerUser
```

- For API details, see AttachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

Use ChangePassword with a CLI

The following code examples show how to use ChangePassword.

CLI

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the --cli-input-json parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the --cli-input-json parameter, start by using the change-password command with the --generate-cli-skeleton parameter, as in the following example.

```
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/{pB9Fo9wJ"
}
```

Next, to change your password, use the change-password command again, this time passing the --cli-input-json parameter to specify your JSON file. The following change-password command uses the --cli-input-json parameter with a JSON file called change-password.json.

```
aws iam change-password \
    --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an InvalidUserType error.

For more information, see How an IAM user changes their own password in the *AWS IAM User Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command changes the password for the user that is running the command. This command can be called by IAM users only. If this command is called when you are signed-in with AWS account (root) credentials, the command returns an `InvalidUserType` error.

```
Edit-IAMPassword -OldPassword "MyOldP@ssw0rd" -NewPassword "MyNewP@ssw0rd"
```

- For API details, see ChangePassword in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command changes the password for the user that is running the command. This command can be called by IAM users only. If this command is called when you are signed-in with AWS account (root) credentials, the command returns an `InvalidUserType` error.

```
Edit-IAMPassword -OldPassword "MyOldP@ssw0rd" -NewPassword "MyNewP@ssw0rd"
```

- For API details, see ChangePassword in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAccessKey` with an AWS SDK or CLI

The following code examples show how to use `CreateAccessKey`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Manage access keys

```
Aws::String AwsDoc::IAM::createAccessKey(const Aws::String &userName,
                                         const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::CreateAccessKeyRequest request;
    request.SetUserName(userName);

    Aws::String result;
    Aws::IAM::Model::CreateAccessKeyOutcome outcome =
 iam.CreateAccessKey(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating access key for IAM user " << userName
                  << ":" << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const auto &accessKey = outcome.GetResult().GetAccessKey();
```

```
        std::cout << "Successfully created access key for IAM user " <<
                  userName << std::endl << "  aws_access_key_id = " <<
                  accessKey.GetAccessKeyId() << std::endl <<
                  " aws_secret_access_key = " << accessKey.GetSecretAccessKey()
 <<
                  std::endl;
        result = accessKey.GetAccessKeyId();
    }

    return result;
}
```

- For API details, see CreateAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To create an access key for an IAM user

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
    --user-name Bob
```

Output:

```
{
    "AccessKey": {
        "UserName": "Bob",
        "Status": "Active",
        "CreateDate": "2015-03-09T18:39:23.411Z",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
    }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateAccessKey in *AWS CLI Command Reference*.

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun createIAMAccessKey(user: String?): String {
    val request =
        CreateAccessKeyRequest {
            userName = user
        }

    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.createAccessKey(request)
        return response.accessKey?.accessKeyId.toString()
    }
}
```

- For API details, see CreateAccessKey in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new access key and secret access key pair and assigns it to the user `David`. Ensure that you save the `AccessKeyId` and `SecretAccessKey` values to a file because this is the only time you can obtain the `SecretAccessKey`. You cannot retrieve it later. If you lose the secret key, you must create a new access key pair.

```
New-IAMAccessKey -UserName David
```

Output:

```
AccessKeyId     : AKIAIOSFODNN7EXAMPLE
CreateDate      : 4/13/2015 1:00:42 PM
SecretAccessKey : wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
Status          : Active
UserName        : David
```

- For API details, see CreateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new access key and secret access key pair and assigns it to the user `David`. Ensure that you save the `AccessKeyId` and `SecretAccessKey` values to a file because this is the only time you can obtain the `SecretAccessKey`. You cannot retrieve it later. If you lose the secret key, you must create a new access key pair.

```
New-IAMAccessKey -UserName David
```

Output:

```
AccessKeyId     : AKIAIOSFODNN7EXAMPLE
CreateDate      : 4/13/2015 1:00:42 PM
SecretAccessKey : wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
Status          : Active
UserName        : David
```

Use `CreateAccountAlias` with an AWS SDK or CLI

The following code examples show how to use `CreateAccountAlias`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::createAccountAlias(const Aws::String &aliasName,
                                     const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::CreateAccountAliasRequest request;
    request.SetAccountAlias(aliasName);

    Aws::IAM::Model::CreateAccountAliasOutcome outcome = iam.CreateAccountAlias(
            request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating account alias " << aliasName << ": "
                  << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully created account alias " << aliasName <<
                  std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateAccountAlias in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To create an account alias

The following `create-account-alias` command creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see CreateAccountAlias in *AWS CLI Command Reference*.

Create the account alias.

```
import { CreateAccountAliasCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} alias - A unique name for the account alias.
 * @returns
 */
export const createAccountAlias = (alias) => {
  const command = new CreateAccountAliasCommand({
    AccountAlias: alias,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see CreateAccountAlias in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.createAccountAlias({ AccountAlias: process.argv[2] }, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

```
suspend fun createIAMAccountAlias(alias: String) {
```

```
    val request =
        CreateAccountAliasRequest {
            accountAlias = alias
        }

    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        iamClient.createAccountAlias(request)
        println("Successfully created account alias named $alias")
    }
}
```

- For API details, see CreateAccountAlias in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the account alias for your AWS account to `mycompanyaws`. The address of the user logon page chages to https://mycompanyaws.signin.aws.amazon.com/console. The original URL using your account ID number instead of the alias (https://<accountidnumber>.signin.aws.amazon.com/console) continues to work. However, any previously defined alias-based URLs stop working.

```
New-IAMAccountAlias -AccountAlias mycompanyaws
```

- For API details, see CreateAccountAlias in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the account alias for your AWS account to `mycompanyaws`. The address of the user logon page chages to https://mycompanyaws.signin.aws.amazon.com/console. The original URL using your account ID number instead of the alias (https://<accountidnumber>.signin.aws.amazon.com/console) continues to work. However, any previously defined alias-based URLs stop working.

```
New-IAMAccountAlias -AccountAlias mycompanyaws
```

- For API details, see CreateAccountAlias in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `CreateGroup` with an AWS SDK or CLI

The following code examples show how to use `CreateGroup`.

CLI

AWS CLI

To create an IAM group

The following `create-group` command creates an IAM group named `Admins`.

```
aws iam create-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the *AWS IAM User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { CreateGroupCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} groupName
 */
export const createGroup = async (groupName) => {
  const command = new CreateGroupCommand({ GroupName: groupName });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see CreateGroup in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new IAM group named `Developers`.

```
New-IAMGroup -GroupName Developers
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Developers
CreateDate : 4/14/2015 11:21:31 AM
GroupId    : QNEJ5PM4NFSQCEXAMPLE1
GroupName  : Developers
Path       : /
```

- For API details, see CreateGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new IAM group named `Developers`.

```
New-IAMGroup -GroupName Developers
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Developers
CreateDate : 4/14/2015 11:21:31 AM
GroupId    : QNEJ5PM4NFSQCEXAMPLE1
GroupName  : Developers
Path       : /
```

- For API details, see CreateGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

                    InstanceProfileName = profileName
                });
            profileArn = profileGetResponse.InstanceProfile.Arn;
        }
        return profileArn;
    }
```

- For API details, see CreateInstanceProfile in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create an instance profile

The following `create-instance-profile` command creates an instance profile named `Webserver`.

```
aws iam create-instance-profile \
    --instance-profile-name Webserver
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
        "Roles": [],
        "CreateDate": "2015-03-09T20:33:19.626Z",
        "InstanceProfileName": "Webserver",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
    }
```

```
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
const { InstanceProfile } = await iamClient.send(
  new CreateInstanceProfileCommand({
    InstanceProfileName: NAMES.ssmOnlyInstanceProfileName,
  }),
);
await waitUntilInstanceProfileExists(
  { client: iamClient },
  { InstanceProfileName: NAMES.ssmOnlyInstanceProfileName },
);
```

- For API details, see CreateInstanceProfile in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new IAM instance profile named `ProfileForDevEC2Instance`. You must separately run the `Add-IAMRoleToInstanceProfile` command to associate the instance profile with an existing IAM role that provides permissions to the instance. Finally, attach the instance

profile to an EC2 instance when you launch it. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or `InstanceProfile_Name` parameter.

```
New-IAMInstanceProfile -InstanceProfileName ProfileForDevEC2Instance
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/
ProfileForDevEC2Instance
CreateDate          : 4/14/2015 11:31:39 AM
InstanceProfileId   : DYMFXL556EY46EXAMPLE1
InstanceProfileName : ProfileForDevEC2Instance
Path                : /
Roles               : {}
```

- For API details, see CreateInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new IAM instance profile named `ProfileForDevEC2Instance`. You must separately run the `Add-IAMRoleToInstanceProfile` command to associate the instance profile with an existing IAM role that provides permissions to the instance. Finally, attach the instance profile to an EC2 instance when you launch it. To do that, use the `New-EC2Instance` cmdlet with either the `InstanceProfile_Arn` or `InstanceProfile_Name` parameter.

```
New-IAMInstanceProfile -InstanceProfileName ProfileForDevEC2Instance
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/
ProfileForDevEC2Instance
CreateDate          : 4/14/2015 11:31:39 AM
InstanceProfileId   : DYMFXL556EY46EXAMPLE1
InstanceProfileName : ProfileForDevEC2Instance
Path                : /
Roles               : {}
```

- For API details, see CreateInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

- For API details, see CreateInstanceProfile in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateLoginProfile` with a CLI

The following code examples show how to use `CreateLoginProfile`.

CLI

AWS CLI

To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
    --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
```

```
}
```

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a (temporary) password for the IAM user named Bob, and sets the flag that requires the user to change the password the next time Bob signs in.

```
New-IAMLoginProfile -UserName Bob -Password P@ssw0rd -PasswordResetRequired $true
```

Output:

```
CreateDate                  PasswordResetRequired             UserName
----------                  ---------------------             --------
4/14/2015 12:26:30 PM       True                              Bob
```

- For API details, see CreateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a (temporary) password for the IAM user named Bob, and sets the flag that requires the user to change the password the next time Bob signs in.

```
New-IAMLoginProfile -UserName Bob -Password P@ssw0rd -PasswordResetRequired $true
```

Output:

```
CreateDate                  PasswordResetRequired             UserName
----------                  ---------------------             --------
4/14/2015 12:26:30 PM       True                              Bob
```

- For API details, see CreateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateOpenIdConnectProvider` with a CLI

The following code examples show how to use `CreateOpenIdConnectProvider`.

CLI

AWS CLI

To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called create-open-id-connect-provider.json.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
```

```
    "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the *AWS IAM User Guide*.

- For API details, see CreateOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an IAM OIDC provider associated with the OIDC compatible provider service found at the URL `https://example.oidcprovider.com` and the client ID `my-testapp-1`. The OIDC provider supplies the thumbprint. To authenticate the thumbprint, follow the steps at http://docs.aws.amazon.com/IAM/latest/UserGuide/identity-providers-oidc-obtain-thumbprint.html.

```
New-IAMOpenIDConnectProvider -Url https://example.oidcprovider.com -ClientIDList
 my-testapp-1 -ThumbprintList 990F419EXAMPLEECF12DDEDA5EXAMPLE52F20D9E
```

Output:

```
arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see CreateOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an IAM OIDC provider associated with the OIDC compatible provider service found at the URL `https://example.oidcprovider.com` and the client ID `my-testapp-1`. The OIDC provider supplies the thumbprint. To authenticate the thumbprint, follow the steps at http://docs.aws.amazon.com/IAM/latest/UserGuide/identity-providers-oidc-obtain-thumbprint.html.

```
New-IAMOpenIDConnectProvider -Url https://example.oidcprovider.com -ClientIDList
 my-testapp-1 -ThumbprintList 990F419EXAMPLEECF12DDEDA5EXAMPLE52F20D9E
```

Output:

```
arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see CreateOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreatePolicy` with an AWS SDK or CLI

The following code examples show how to use `CreatePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Manage policies
- Set up Attribute-Based Access Control
- Work with the IAM Policy Builder API

.NET

- For API details, see CreatePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named `my-policy`. The file `policy.json` is a JSON document in the current folder that grants read only access to the `shared` folder in an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
```

```
                "arn:aws:s3:::amzn-s3-demo-bucket/shared/*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "CreateDate": "2015-06-01T19:31:18.620Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
        "UpdateDate": "2015-06-01T19:31:18.620Z"
    }
}
```

For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the *AWS CLI User Guide*.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named `my-policy` with an immutable description.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --description "This policy grants access to all Put, Get, and List actions
 for amzn-s3-demo-bucket"
```

Contents of policy.json:

```
{
```

```
   "Version":"2012-10-17",
   "Statement": [
       {
           "Effect": "Allow",
           "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T22:38:47+00:00",
        "UpdateDate": "2023-05-24T22:38:47+00:00"
    }
}
```

For more information on Idenity-based Policies, see Identity-based policies and resource-based policies in the *AWS IAM User Guide*.

Example 3: To create a customer managed policy with tags

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` parameter can

be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `amzn-s3-demo-bucket`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Contents of policy.json:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new IAM policy in the current AWS account named `MySamplePolicy` The file `MySamplePolicy.json` provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicy -PolicyName MySamplePolicy -PolicyDocument (Get-Content -Raw
 MySamplePolicy.json)
```

Output:

```
Arn              : arn:aws:iam::123456789012:policy/MySamplePolicy
AttachmentCount  : 0
CreateDate       : 4/14/2015 2:45:59 PM
DefaultVersionId : v1
Description      :
IsAttachable     : True
Path             : /
PolicyId         : LD4KP6HVFE7WGEXAMPLE1
PolicyName       : MySamplePolicy
```

```
UpdateDate       : 4/14/2015 2:45:59 PM
```

- For API details, see CreatePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new IAM policy in the current AWS account named `MySamplePolicy` The file `MySamplePolicy.json` provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicy -PolicyName MySamplePolicy -PolicyDocument (Get-Content -Raw
 MySamplePolicy.json)
```

Output:

```
Arn              : arn:aws:iam::123456789012:policy/MySamplePolicy
AttachmentCount  : 0
CreateDate       : 4/14/2015 2:45:59 PM

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreatePolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `CreatePolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage policies

CLI

AWS CLI

To create a new version of a managed policy

This example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --policy-document file://NewPolicyVersion.json \
    --set-as-default
```

Output:

```
{
    "PolicyVersion": {
        "CreateDate": "2015-06-16T18:56:03.721Z",
        "VersionId": "v2",
        "IsDefaultVersion": true
    }
}
```

For more information, see Versioning IAM policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new "v2" version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version. The `NewPolicyVersion.json` file provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy -
PolicyDocument (Get-content -Raw NewPolicyVersion.json) -SetAsDefault $true
```

Output:

```
CreateDate                          Document                IsDefaultVersion
          VersionId
----------                          --------                ----------------
          ---------
4/15/2015 10:54:54 AM                                       True
          v2
```

- For API details, see CreatePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new "v2" version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version. The `NewPolicyVersion.json` file provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```
New-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy -
PolicyDocument (Get-content -Raw NewPolicyVersion.json) -SetAsDefault $true
```

Output:

```
CreateDate                          Document                IsDefaultVersion
          VersionId
----------                          --------                ----------------
          ---------
4/15/2015 10:54:54 AM                                       True
          v2
```

- For API details, see CreatePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateRole` with an AWS SDK or CLI

The following code examples show how to use `CreateRole`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Manage roles
- Work with Streams and Time-to-Live

.NET

SDK for .NET

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::createIamRole(
```

```
        const Aws::String &roleName,
        const Aws::String &policy,
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient client(clientConfig);
    Aws::IAM::Model::CreateRoleRequest request;

    request.SetRoleName(roleName);
    request.SetAssumeRolePolicyDocument(policy);

    Aws::IAM::Model::CreateRoleOutcome outcome = client.CreateRole(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error creating role. " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        const Aws::IAM::Model::Role iamRole = outcome.GetResult().GetRole();
        std::cout << "Created role " << iamRole.GetRoleName() << "\n";
        std::cout << "ID: " << iamRole.GetRoleId() << "\n";
        std::cout << "ARN: " << iamRole.GetArn() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateRole in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create an IAM role

The following `create-role` command creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
```

```
                    "Principal": {
                        "AWS": "arn:aws:iam::12345678012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following command creates an IAM Role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
```

```
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

- For API details, see CreateRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new role named `MyNewRole` and attaches to it the policy found in the file `NewRoleTrustPolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file. The policy document displayed in the output is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = New-IAMRole -AssumeRolePolicyDocument (Get-Content -raw
 NewRoleTrustPolicy.json) -RoleName MyNewRole
$results
```

Output:

```

Use `CreateSAMLProvider` with an AWS SDK or CLI

The following code examples show how to use `CreateSAMLProvider`.

CLI

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --name MySAMLProvider
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see CreateSAMLProvider in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { CreateSAMLProviderCommand, IAMClient } from "@aws-sdk/client-iam";
import { readFileSync } from "node:fs";
import * as path from "node:path";
```

```
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";

const client = new IAMClient({});

/**
 * This sample document was generated using Auth0.
 * For more information on generating this document,
 see https://docs.aws.amazon.com/IAM/latest/UserGuide/
id_roles_providers_create_saml.html#samlstep1.
 */
const sampleMetadataDocument = readFileSync(
  path.join(
    dirnameFromMetaUrl(import.meta.url),
    "../../../../resources/sample_files/sample_saml_metadata.xml",
  ),
);

/**
 *
 * @param {*} providerName
 * @returns
 */
export const createSAMLProvider = async (providerName) => {
  const command = new CreateSAMLProviderCommand({
    Name: providerName,
    SAMLMetadataDocument: sampleMetadataDocument.toString(),
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see [CreateSAMLProvider](#) in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new SAML provider entity in IAM. It is named `MySAMLProvider` and is described by the SAML metadata document found in the file

`SAMLMetaData.xml`, which was separately downloaded from the SAML service provider's web site.

```
New-IAMSAMLProvider -Name MySAMLProvider -SAMLMetadataDocument (Get-Content -Raw
 SAMLMetaData.xml)
```

Output:

```
arn:aws:iam::123456789012:saml-provider/MySAMLProvider
```

- For API details, see CreateSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new SAML provider entity in IAM. It is named `MySAMLProvider` and is described by the SAML metadata document found in the file `SAMLMetaData.xml`, which was separately downloaded from the SAML service provider's web site.

```
New-IAMSAMLProvider -Name MySAMLProvider -SAMLMetadataDocument (Get-Content -Raw
 SAMLMetaData.xml)
```

Output:

```
arn:aws:iam::123456789012:saml-provider/MySAMLProvider
```

- For API details, see CreateSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `CreateServiceLinkedRole` with an AWS SDK or CLI

The following code examples show how to use `CreateServiceLinkedRole`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Create an IAM service-linked role.
    /// </summary>
    /// <param name="serviceName">The name of the AWS Service.</param>
    /// <param name="description">A description of the IAM service-linked role.</
param>
    /// <returns>The IAM role that was created.</returns>
    public async Task<Role> CreateServiceLinkedRoleAsync(string serviceName,
 string description)
    {
        var request = new CreateServiceLinkedRoleRequest
        {
            AWSServiceName = serviceName,
            Description = description
        };

        var response = await _IAMService.CreateServiceLinkedRoleAsync(request);
        return response.Role;
    }
```

- For API details, see CreateServiceLinkedRole in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To create a service-linked role

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
    --aws-service-name lex.amazonaws.com \
    --description "My service-linked role to support Lex"
```

Output:

```
{
    "Role": {
        "Path": "/aws-service-role/lex.amazonaws.com/",
        "RoleName": "AWSServiceRoleForLexBots",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
        "CreateDate": "2019-04-17T20:34:14+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "sts:AssumeRole"
                    ],
                    "Effect": "Allow",
                    "Principal": {
                        "Service": [
                            "lex.amazonaws.com"
                        ]
                    }
                }
            ]
        }
    }
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see CreateServiceLinkedRole in *AWS CLI Command Reference*.

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a service-linked role.

```
import {
  CreateServiceLinkedRoleCommand,
  GetRoleCommand,
  IAMClient,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} serviceName
 */
export const createServiceLinkedRole = async (serviceName) => {
  const command = new CreateServiceLinkedRoleCommand({
    // For a list of AWS services that support service-linked roles,
    // see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_aws-
services-that-work-with-iam.html.
    //
```

```
    // For a list of AWS service endpoints, see https://docs.aws.amazon.com/
general/latest/gr/aws-service-information.html.
    AWSServiceName: serviceName,
  });
  try {
    const response = await client.send(command);
    console.log(response);
    return response;
  } catch (caught) {
    if (
      caught instanceof Error &&
      caught.name === "InvalidInputException" &&
      caught.message.includes(
        "Service role name AWSServiceRoleForElasticBeanstalk has been taken in
 this account",
      )
    ) {
      console.warn(caught.message);
      return client.send(
        new GetRoleCommand({ RoleName: "AWSServiceRoleForElasticBeanstalk" }),
      );
    }
    throw caught;
  }
};
```

                throw ServiceHandlerError.noSuchRole
            }
            return role
        } catch {
            print("ERROR: createServiceLinkedRole:", dump(error))
            throw error
        }
    }
```

- For API details, see CreateServiceLinkedRole in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateUser` with an AWS SDK or CLI

The following code examples show how to use `CreateUser`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::CreateUserRequest create_request;
    create_request.SetUserName(userName);

    auto create_outcome = iam.CreateUser(create_request);
    if (!create_outcome.IsSuccess()) {
        std::cerr << "Error creating IAM user " << userName << ":" <<
                  create_outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully created IAM user " << userName << std::endl;
    }

    return create_outcome.IsSuccess();
```

- For API details, see CreateUser in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
    --user-name Bob
```

Output:

```
{
    "User": {
        "UserName": "Bob",
        "Path": "/",
        "CreateDate": "2023-06-08T03:20:41.270Z",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

Example 2: To create an IAM user at a specified path

The following `create-user` command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
    "User": {
```

```
        "Path": "/division_abc/subdivision_xyz/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
        "CreateDate": "2023-05-24T18:20:17+00:00"
    }
}
```

For more information, see IAM identifiers in the *AWS IAM User Guide*.

Example 3: To Create an IAM User with tags

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-user \
    --user-name Bob \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
```

```
            }
        ]
    }
}
```

For more information, see Tagging IAM users in the *AWS IAM User Guide*.

Example 3: To create an IAM user with a set permissions boundary

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
    --user-name Bob \
    --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-24T17:50:53+00:00",
        "PermissionsBoundary": {
        "PermissionsBoundaryType": "Policy",
        "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
        }
    }
}
```

For more information, see Permissions boundaries for IAM entities in the *AWS IAM User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

Use `CreateVirtualMfaDevice` with a CLI

The following code examples show how to use `CreateVirtualMfaDevice`.

CLI

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
    --virtual-mfa-device-name BobsMFADevice \
    --outfile C:/QRCode.png \
    --bootstrap-method QRCodePNG
```

Output:

```
{
    "VirtualMFADevice": {
        "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see CreateVirtualMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new virtual MFA device. Lines 2 and 3 extract the `Base32StringSeed` value that the virtual MFA software program needs to create an account (as an alternative to the QR code). After you configure the program with the value, get two sequential authentication codes from the program. Finally, use the last command to link the virtual MFA device to the IAM user Bob and synchronize the account with the two authentication codes.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$SR = New-Object System.IO.StreamReader($Device.Base32StringSeed)
$base32stringseed = $SR.ReadToEnd()
$base32stringseed
CZWZMCQNW4DEXAMPLE3VOUGXJFZYSUW7EXAMPLECR4NJFD65GX2SLUDW2EXAMPLE
```

Output:

```
-- Pause here to enter base-32 string seed code into virtual MFA program to
 register account. --
```

```
Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

Example 2: This example creates a new virtual MFA device. Lines 2 and 3 extract the QRCodePNG value and write it to a file. This image can be scanned by the virtual MFA software program to create an account (as an alternative to manually entering the Base32StringSeed value). After you create the account in your virtual MFA program, get two sequential authentication codes and enter them in the last commands to link the virtual MFA device to the IAM user Bob and synchronize the account.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$BR = New-Object System.IO.BinaryReader($Device.QRCodePNG)
$BR.ReadBytes($BR.BaseStream.Length) | Set-Content -Encoding Byte -Path
 QRCode.png
```

Output:

```
 -- Pause here to scan PNG with virtual MFA program to register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

- For API details, see CreateVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new virtual MFA device. Lines 2 and 3 extract the `Base32StringSeed` value that the virtual MFA software program needs to create an account (as an alternative to the QR code). After you configure the program with the value, get two sequential authentication codes from the program. Finally, use the last command to link the virtual MFA device to the IAM user Bob and synchronize the account with the two authentication codes.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$SR = New-Object System.IO.StreamReader($Device.Base32StringSeed)
$base32stringseed = $SR.ReadToEnd()
$base32stringseed
CZWZMCQNW4DEXAMPLE3VOUGXJFZYSUW7EXAMPLECR4NJFD65GX2SLUDW2EXAMPLE
```

Output:

```
-- Pause here to enter base-32 string seed code into virtual MFA program to
 register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

Example 2: This example creates a new virtual MFA device. Lines 2 and 3 extract the QRCodePNG value and write it to a file. This image can be scanned by the virtual MFA software program to create an account (as an alternative to manually entering the Base32StringSeed value). After you create the account in your virtual MFA program, get two sequential authentication codes and enter them in the last commands to link the virtual MFA device to the IAM user Bob and synchronize the account.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$BR = New-Object System.IO.BinaryReader($Device.QRCodePNG)
$BR.ReadBytes($BR.BaseStream.Length) | Set-Content -Encoding Byte -Path
 QRCode.png
```

Output:

```
 -- Pause here to scan PNG with virtual MFA program to register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012
```

- For API details, see CreateVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeactivateMfaDevice` with a CLI

The following code examples show how to use `DeactivateMfaDevice`.

CLI

AWS CLI

To deactivate an MFA device

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see DeactivateMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command disables the hardware MFA device associated with the user Bob that has the serial number 123456789012.

```
Disable-IAMMFADevice -UserName "Bob" -SerialNumber "123456789012"
```

Example 2: This command disables the virtual MFA device associated with the user `David` that has the ARN `arn:aws:iam::210987654321:mfa/David`. Note that virtual MFA device is not deleted from the account. The virtual device is still present and appears in the output of the `Get-IAMVirtualMFADevice` command. Before you can create a new virtual MFA device for the same user, you must delete the old one by using the `Remove-IAMVirtualMFADevice` command.

```
Disable-IAMMFADevice -UserName "David" -SerialNumber
 "arn:aws:iam::210987654321:mfa/David"
```

- For API details, see DeactivateMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command disables the hardware MFA device associated with the user Bob that has the serial number 123456789012.

```
Disable-IAMMFADevice -UserName "Bob" -SerialNumber "123456789012"
```

Example 2: This command disables the virtual MFA device associated with the user `David` that has the ARN `arn:aws:iam::210987654321:mfa/David`. Note that virtual MFA device is not deleted from the account. The virtual device is still present and appears in the output of the `Get-IAMVirtualMFADevice` command. Before you can create a new virtual MFA device for the same user, you must delete the old one by using the `Remove-IAMVirtualMFADevice` command.

```
Disable-IAMMFADevice -UserName "David" -SerialNumber
 "arn:aws:iam::210987654321:mfa/David"
```

- For API details, see DeactivateMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete an access key for an IAM user

The following `delete-access-key` command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
    --access-key-id AKIDPMS9RO4H3FEXAMPLE \
    --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccessKey in *AWS CLI Command Reference*.

        let userName: String?

        if user != nil {
            userName = user!.userName
        } else {
            userName = nil
        }

        let input = DeleteAccessKeyInput(
```

```
            accessKeyId: key.accessKeyId,
            userName: userName
        )
        do {
            _ = try await iamClient.deleteAccessKey(input: input)
        } catch {
            print("ERROR: deleteAccessKey:", dump(error))
            throw error
        }
    }
```

- For API details, see DeleteAccessKey in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAccountAlias` with an AWS SDK or CLI

The following code examples show how to use `DeleteAccountAlias`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::deleteAccountAlias(const Aws::String &accountAlias,
                                     const Aws::Client::ClientConfiguration
 &clientConfig) {
```

```
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::DeleteAccountAliasRequest request;
    request.SetAccountAlias(accountAlias);

    const auto outcome = iam.DeleteAccountAlias(request);
    if (!outcome.IsSuccess()) {
        std::cerr << "Error deleting account alias " << accountAlias << ": "
                  << outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully deleted account alias " << accountAlias <<
                  std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteAccountAlias in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete an account alias

The following `delete-account-alias` command removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see DeleteAccountAlias in *AWS CLI Command Reference*.

    @iam_client.delete_account_alias(account_alias: account_alias)
    true
  rescue Aws::IAM::Errors::ServiceError => e
    @logger.error("Error deleting account alias: #{e.message}")
    false
  end
end
```

- For API details, see DeleteAccountAlias in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAccountPasswordPolicy` with a CLI

The following code examples show how to use `DeleteAccountPasswordPolicy`.

CLI

AWS CLI

To delete the current account password policy

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccountPasswordPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the password policy for the AWS account and resets all values to their original defaults. If a password policy does not currently exist, the following error message appears: The account policy with name PasswordPolicy cannot be found.

```
Remove-IAMAccountPasswordPolicy
```

- For API details, see DeleteAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the password policy for the AWS account and resets all values to their original defaults. If a password policy does not currently exist, the following error message appears: The account policy with name PasswordPolicy cannot be found.

```
Remove-IAMAccountPasswordPolicy
```

- For API details, see DeleteAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteGroup` with an AWS SDK or CLI

The following code examples show how to use `DeleteGroup`.

CLI

AWS CLI

To delete an IAM group

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the *AWS IAM User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteGroupCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} groupName
 */
export const deleteGroup = async (groupName) => {
  const command = new DeleteGroupCommand({
    GroupName: groupName,
  });

  const response = await client.send(command);
```

```
  console.log(response);
  return response;
};
```

- For API details, see DeleteGroup in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM group named `MyTestGroup`. The first command removes any IAM users that are members of the group, and the second command deletes the IAM group. Both commands work without any prompts for confirmation.

```
(Get-IAMGroup -GroupName MyTestGroup).Users | Remove-IAMUserFromGroup -GroupName
 MyTestGroup -Force
Remove-IAMGroup -GroupName MyTestGroup -Force
```

- For API details, see DeleteGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM group named `MyTestGroup`. The first command removes any IAM users that are members of the group, and the second command deletes the IAM group. Both commands work without any prompts for confirmation.

```
(Get-IAMGroup -GroupName MyTestGroup).Users | Remove-IAMUserFromGroup -GroupName
 MyTestGroup -Force
Remove-IAMGroup -GroupName MyTestGroup -Force
```

- For API details, see DeleteGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteGroupPolicy` with a CLI

The following code examples show how to use `DeleteGroupPolicy`.

CLI

AWS CLI

To delete a policy from an IAM group

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see DeleteGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the inline policy named `TesterPolicy` from the IAM group `Testers`. The users in that group immediately lose the permissions defined in that policy.

```
Remove-IAMGroupPolicy -GroupName Testers -PolicyName TestPolicy
```

- For API details, see DeleteGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the inline policy named `TesterPolicy` from the IAM group `Testers`. The users in that group immediately lose the permissions defined in that policy.

```
Remove-IAMGroupPolicy -GroupName Testers -PolicyName TestPolicy
```

- For API details, see DeleteGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteInstanceProfile` with an AWS SDK or CLI

The following code examples show how to use `DeleteInstanceProfile`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Build and manage a resilient service

                f"policies and delete role {role_name}: {err}"
            )
            if err.response["Error"]["Code"] == "NoSuchEntity":
                log.info(
                    "Instance profile %s doesn't exist, nothing to do.",
profile_name
                )
```

- For API details, see DeleteInstanceProfile in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteLoginProfile` with a CLI

The following code examples show how to use `DeleteLoginProfile`.

CLI

AWS CLI

To delete a password for an IAM user

The following `delete-login-profile` command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the login profile from the IAM user named Bob. This prevents the user from signing-in to the AWS console. It does not prevent the user from running any AWS CLI, PowerShell, or API calls using AWS access keys that might still be attached to the user account.

```
Remove-IAMLoginProfile -UserName Bob
```

- For API details, see DeleteLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the login profile from the IAM user named Bob. This prevents the user from signing-in to the AWS console. It does not prevent the user from

running any AWS CLI, PowerShell, or API calls using AWS access keys that might still be attached to the user account.

```
Remove-IAMLoginProfile -UserName Bob
```

- For API details, see DeleteLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteOpenIdConnectProvider` with a CLI

The following code examples show how to use `DeleteOpenIdConnectProvider`.

CLI

AWS CLI

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`. Ensure that you update or delete any roles that reference this provider in the `Principal` element of the role's trust policy.

```
Remove-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see DeleteOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`. Ensure that you update or delete any roles that reference this provider in the `Principal` element of the role's trust policy.

```
Remove-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see DeleteOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeletePolicy` with an AWS SDK or CLI

The following code examples show how to use `DeletePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users
- Manage policies

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun deleteIAMPolicy(policyARNVal: String?) {
    val request =
```

```
        DeletePolicyRequest {
            policyArn = policyARNVal
        }

    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        iamClient.deletePolicy(request)
        println("Successfully deleted $policyARNVal")
    }
}
```

- For API details, see DeletePolicy in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`. Before you can delete the policy, you must first delete all versions except the default by running `Remove-IAMPolicyVersion`. You must also detach the policy from any IAM users, groups, or roles.

```
Remove-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Example 2: This example deletes a policy by first deleting all the non-default policy versions, detaching it from all attached IAM entities, and finally deleting the policy itself. The first line retrieves the policy object. The second line retrieves all the policy versions that are not flagged as the default version into a collection and then deletes each policy in the collection. The third line retrieves all of the IAM users, groups, and roles to which the policy is attached. Lines four through six detach the policy from each attached entity. The last line uses this command to remove the managed policy as well as the remaining default version. The example includes the `-Force` switch parameter on any line that needs it to suppress prompts for confirmation.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
$attached = Get-IAMEntitiesForPolicy -PolicyArn $pol.Arn
```

```
$attached.PolicyGroups | Unregister-IAMGroupPolicy -PolicyArn $pol.arn
$attached.PolicyRoles | Unregister-IAMRolePolicy -PolicyArn $pol.arn
$attached.PolicyUsers | Unregister-IAMUserPolicy -PolicyArn $pol.arn
Remove-IAMPolicy $pol.Arn -Force
```

- For API details, see DeletePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`. Before you can delete the policy, you must first delete all versions except the default by running `Remove-IAMPolicyVersion`. You must also detach the policy from any IAM users, groups, or roles.

```
Remove-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Example 2: This example deletes a policy by first deleting all the non-default policy versions, detaching it from all attached IAM entities, and finally deleting the policy itself. The first line retrieves the policy object. The second line retrieves all the policy versions that are not flagged as the default version into a collection and then deletes each policy in the collection. The third line retrieves all of the IAM users, groups, and roles to which the policy is attached. Lines four through six detach the policy from each attached entity. Use `DeletePolicyVersion` with a CLI

The following code examples show how to use `DeletePolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Roll back a policy version

CLI

AWS CLI

To delete a version of a managed policy

This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
Remove-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MySamplePolicy -VersionID v2
```

Example 2: This example deletes a policy by first deleting all non-default policy versions and then deleting the policy itself. The first line retrieves the policy object. The second line retrieves all of the policy versions that are not flagged as the default into a collection and then uses this command to delete each policy in the collection. The last line removes the policy itself as well as the remaining default version. Note that to successfully delete a managed policy, you must also detach the policy from any users, groups, or roles by using the `Unregister-IAMUserPolicy`, `Unregister-IAMGroupPolicy`, and `Unregister-IAMRolePolicy` commands. See the example for the `Remove-IAMPolicy` cmdlet.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
Remove-IAMPolicy -PolicyArn $pol.Arn -force
```

- For API details, see DeletePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
Remove-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MySamplePolicy -VersionID v2
```

Example 2: This example deletes a policy by first deleting all non-default policy versions and then deleting the policy itself. The first line retrieves the policy object. The second line retrieves all of the policy versions that are not flagged as the default into a collection and then uses this command to delete each policy in the collection. The last line removes the policy itself as well as the remaining default version. Note that to successfully delete a managed policy, you must also detach the policy from any users, groups, or roles by using the `Unregister-IAMUserPolicy`, `Unregister-IAMGroupPolicy`, and `Unregister-IAMRolePolicy` commands. See the example for the `Remove-IAMPolicy` cmdlet.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

```
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
 Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
Remove-IAMPolicy -PolicyArn $pol.Arn -force
```

- For API details, see DeletePolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

    --role-name "$role_name")

  local error_code=${?}

  if [[ $error_code -ne 0 ]]; then
    aws_cli_error_log $error_code
    errecho "ERROR: AWS reports delete-role operation failed.\n$response"
    return 1
  fi

  iecho "delete-role response:$response"
  iecho

  return 0
}
```

- For API details, see DeleteRole in *AWS CLI Command Reference*.

CLI

AWS CLI

To delete an IAM role

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteRole in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "encoding/json"
 "log"

 "github.com/aws/aws-sdk-go-v2/aws"
 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// RoleWrapper encapsulates AWS Identity and Access Management (IAM) role actions
// used in the examples.
// It contains an IAM service client that is used to perform role actions.
type RoleWrapper struct {
 IamClient *iam.Client
}

// DeleteRole deletes a role. All attached policies must be detached before a
// role can be deleted.
func (wrapper RoleWrapper) DeleteRole(ctx context.Context, roleName string) error
 {
 _, err := wrapper.IamClient.DeleteRole(ctx, &iam.DeleteRoleInput{
  RoleName: aws.String(roleName),
 })
 if err != nil {
  log.Printf("Couldn't delete role %v. Here's why: %v\n", roleName, err)
 }
```

```
 return err
}
```

- For API details, see DeleteRole in *AWS SDK for Go API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete the role.

```
import { DeleteRoleCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 */
export const deleteRole = (roleName) => {
  const command = new DeleteRoleCommand({ RoleName: roleName });
  return client.send(command);
};
```

- For API details, see DeleteRole in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the role named `MyNewRole` from the current IAM account. Before you can delete the role you must first use the `Unregister-`

`IAMRolePolicy` command to detach any managed policies. Inline policies are deleted with the role.

```
Remove-IAMRole -RoleName MyNewRole
```

Example 2: This example detaches any managed policies from the role named `MyNewRole` and then deletes the role. The first line retrieves any managed policies attached to the role as a collection and then detaches each policy in the collection from the role. The second line deletes the role itself. Inline policies are deleted along with the role.

```
Get-IAMAttachedRolePolicyList -RoleName MyNewRole | Unregister-IAMRolePolicy -
RoleName MyNewRole
Remove-IAMRole -RoleName MyNewRole
```

- For API details, see DeleteRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the role named `MyNewRole` from the current IAM account. Before you can delete the role you must first use the `Unregister-IAMRolePolicy` command to detach any managed policies. Inline policies are deleted with the role.

```
Remove-IAMRole -RoleName MyNewRole
```

Example 2: This example detaches any managed policies from the role named `MyNewRole` and then deletes the role. The first line retrieves any managed policies attached to the role as a collection and then detaches each policy in the collection from the role. The second line deletes the role itself. Inline policies are deleted along with the role.

```
Get-IAMAttachedRolePolicyList -RoleName MyNewRole | Unregister-IAMRolePolicy -
RoleName MyNewRole
Remove-IAMRole -RoleName MyNewRole
```

- For API details, see DeleteRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    public func deleteRole(role: IAMClientTypes.Role) async throws {
        let input = DeleteRoleInput(
            roleName: role.roleName
        )
        do {
            _ = try await iamClient.deleteRole(input: input)
        } catch {
            print("ERROR: deleteRole:", dump(error))
            throw error
```

```
        }
    }
```

- For API details, see DeleteRole in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteRolePermissionsBoundary` with a CLI

The following code examples show how to use `DeleteRolePermissionsBoundary`.

CLI

AWS CLI

To delete a permissions boundary from an IAM role

The following `delete-role-permissions-boundary` example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteRolePermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to remove the permission boundary attached to an IAM role.

```
Remove-IAMRolePermissionsBoundary -RoleName MyRoleName
```

- For API details, see DeleteRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to remove the permission boundary attached to an IAM role.

```
Remove-IAMRolePermissionsBoundary -RoleName MyRoleName
```

- For API details, see DeleteRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `DeleteRolePolicy`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Delete an IAM role policy.
    /// </summary>
    /// <param name="roleName">The name of the IAM role.</param>
    /// <param name="policyName">The name of the IAM role policy to delete.</
param>
```

```
    /// <returns>A Boolean value indicating the success of the action.</returns>
    public async Task<bool> DeleteRolePolicyAsync(string roleName, string
policyName)
    {
        var response = await _IAMService.DeleteRolePolicyAsync(new
DeleteRolePolicyRequest
        {
            PolicyName = policyName,
            RoleName = roleName,
        });

        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
```

- For API details, see DeleteRolePolicy in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To remove a policy from an IAM role

The following `delete-role-policy` command removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DeleteRolePolicy in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteRolePolicyCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 * @param {string} policyName
 */
export const deleteRolePolicy = (roleName, policyName) => {
  const command = new DeleteRolePolicyCommand({
    RoleName: roleName,
    PolicyName: policyName,
  });
  return client.send(command);
};
```

- For API details, see DeleteRolePolicy in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the inline policy `S3AccessPolicy` that is embedded in the IAM role `S3BackupRole`.

```
Remove-IAMRolePolicy -PolicyName S3AccessPolicy -RoleName S3BackupRole
```

- For API details, see DeleteRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the inline policy `S3AccessPolicy` that is embedded in the IAM role `S3BackupRole`.

```
Remove-IAMRolePolicy -PolicyName S3AccessPolicy -RoleName S3BackupRole
```

- For API details, see DeleteRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteSAMLProvider` with an AWS SDK or CLI

The following code examples show how to use `DeleteSAMLProvider`.

CLI

AWS CLI

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteSAMLProvider in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteSAMLProviderCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} providerArn
 * @returns
 */
export const deleteSAMLProvider = async (providerArn) => {
  const command = new DeleteSAMLProviderCommand({
    SAMLProviderArn: providerArn,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see DeleteSAMLProvider in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
Remove-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFSProvider
```

- For API details, see DeleteSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
Remove-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFSProvider
```

- For API details, see DeleteSAMLProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `DeleteServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::deleteServerCertificate(const Aws::String &certificateName,
                                          const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::DeleteServerCertificateRequest request;
    request.SetServerCertificateName(certificateName);

    const auto outcome = iam.DeleteServerCertificate(request);
    bool result = true;
```

```
    if (!outcome.IsSuccess()) {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error deleting server certificate " << certificateName
 <<
                      ": " << outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << certificateName
                      << "' not found." << std::endl;
        }
    }
    else {
        std::cout << "Successfully deleted server certificate " <<
 certificateName
                  << std::endl;
    }

    return result;
}
```

- For API details, see DeleteServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To delete a server certificate from your AWS account

The following `delete-server-certificate` command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete a server certificate.

```
import { DeleteServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} certName
 */
export const deleteServerCertificate = (certName) => {
  const command = new DeleteServerCertificateCommand({
    ServerCertificateName: certName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.deleteServerCertificate(
  { ServerCertificateName: "CERTIFICATE_NAME" },
  function (err, data) {
    if (err) {
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
  }
);
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the server certificate named `MyServerCert`.

```
Remove-IAMServerCertificate -ServerCertificateName MyServerCert
```

- For API details, see DeleteServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the server certificate named `MyServerCert`.

```
Remove-IAMServerCertificate -ServerCertificateName MyServerCert
```

- For API details, see DeleteServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteServiceLinkedRole` with an AWS SDK or CLI

The following code examples show how to use `DeleteServiceLinkedRole`.

CLI

AWS CLI

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see DeleteServiceLinkedRole in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>

 "github.com/aws/aws-sdk-go-v2/aws"
 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// RoleWrapper encapsulates AWS Identity and Access Management (IAM) role actions
// used in the examples.
// It contains an IAM service client that is used to perform role actions.
type RoleWrapper struct {
 IamClient *iam.Client
}

// DeleteServiceLinkedRole deletes a service-linked role.
func (wrapper RoleWrapper) DeleteServiceLinkedRole(ctx context.Context, roleName
 string) error {
 _, err := wrapper.IamClient.DeleteServiceLinkedRole(ctx,
 &iam.DeleteServiceLinkedRoleInput{
  RoleName: aws.String(roleName)},
 )
 if err != nil {
  log.Printf("Couldn't delete service-linked role %v. Here's why: %v\n",
 roleName, err)
 }
 return err
}
```

- For API details, see DeleteServiceLinkedRole in *AWS SDK for Go API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { DeleteServiceLinkedRoleCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 */
export const deleteServiceLinkedRole = (roleName) => {
  const command = new DeleteServiceLinkedRoleCommand({ RoleName: roleName });
  return client.send(command);
};
```

- For API details, see DeleteServiceLinkedRole in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deleted the service linked role. Please note that if the service is still using this role, then this command results in a failure.

```
Remove-IAMServiceLinkedRole -RoleName
 AWSServiceRoleForAutoScaling_RoleNameEndsWithThis
```

- For API details, see DeleteServiceLinkedRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deleted the service linked role. Please note that if the service is still using this role, then this command results in a failure.

```
Remove-IAMServiceLinkedRole -RoleName
 AWSServiceRoleForAutoScaling_RoleNameEndsWithThis
```

- For API details, see DeleteServiceLinkedRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
pub async fn delete_service_linked_role(
    client: &iamClient,
    role_name: &str,
) -> Result<(), iamError> {
    client
        .delete_service_linked_role()
        .role_name(role_name)
```

```
        .send()
        .await?;

    Ok(())
}
```

- For API details, see DeleteServiceLinkedRole in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteSigningCertificate` with a CLI

The following code examples show how to use `DeleteSigningCertificate`.

CLI

AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \
    --user-name Bob \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see DeleteSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the signing certificate with the ID `Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU` from the IAM user named Bob.

```
Remove-IAMSigningCertificate -UserName Bob -CertificateId
 Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU
```

- For API details, see DeleteSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the signing certificate with the ID `Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU` from the IAM user named Bob.

```
Remove-IAMSigningCertificate -UserName Bob -CertificateId
 Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU
```

- For API details, see DeleteSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteUser` with an AWS SDK or CLI

The following code examples show how to use `DeleteUser`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Create read-only and read-write users

Use `DeleteUserPermissionsBoundary` with a CLI

The following code examples show how to use `DeleteUserPermissionsBoundary`.

CLI

AWS CLI

To delete a permissions boundary from an IAM user

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \
    --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteUserPermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to remove the permission boundary attached to an IAM user.

```
Remove-IAMUserPermissionsBoundary -UserName joe
```

- For API details, see DeleteUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to remove the permission boundary attached to an IAM user.

```
Remove-IAMUserPermissionsBoundary -UserName joe
```

- For API details, see DeleteUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `DeleteUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
```

```
    /// Delete an IAM user policy.
    /// </summary>
    /// <param name="policyName">The name of the IAM policy to delete.</param>
    /// <param name="userName">The username of the IAM user.</param>
    /// <returns>A Boolean value indicating the success of the action.</returns>
    public async Task<bool> DeleteUserPolicyAsync(string policyName, string
userName)
    {
        var response = await _IAMService.DeleteUserPolicyAsync(new
DeleteUserPolicyRequest { PolicyName = policyName, UserName = userName });

        return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
    }
```

- For API details, see DeleteUserPolicy in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To remove a policy from an IAM user

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see DeleteUserPolicy in *AWS CLI Command Reference*.

```

- For API details, see DeleteUserPolicy in *AWS SDK for Go API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the inline policy named `AccessToEC2Policy` that is embedded in the IAM user named Bob.

```
Remove-IAMUserPolicy -PolicyName AccessToEC2Policy -UserName Bob
```

Example 2: This example finds all of the inline polices that are embedded in the IAM user named `Theresa` and then deletes them.

```
$inlinepols = Get-IAMUserPolicies -UserName Theresa
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName
 Theresa -Force}
```

- For API details, see DeleteUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the inline policy named `AccessToEC2Policy` that is embedded in the IAM user named Bob.

```
Remove-IAMUserPolicy -PolicyName AccessToEC2Policy -UserName Bob
```

Example 2: This example finds all of the inline polices that are embedded in the IAM user named `Theresa` and then deletes them.

```
$inlinepols = Get-IAMUserPolicies -UserName Theresa
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName
 Theresa -Force}
```

- For API details, see DeleteUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `DeleteVirtualMfaDevice` with a CLI

The following code examples show how to use `DeleteVirtualMfaDevice`.

CLI

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the *AWS IAM User Guide*.

- For API details, see DeleteVirtualMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the IAM virtual MFA device whose ARN is `arn:aws:iam::123456789012:mfa/bob`.

```
Remove-IAMVirtualMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/bob
```

Example 2: This example checks to see whether the IAM user Theresa has an MFA device assigned. If one is found, the device is disabled for the IAM user. If the device is virtual, then it is also deleted.

```
$mfa = Get-IAMMFADevice -UserName Theresa
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -
SerialNumber $mfa.SerialNumber }
}
```

- For API details, see DeleteVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the IAM virtual MFA device whose ARN is `arn:aws:iam::123456789012:mfa/bob`.

```
Remove-IAMVirtualMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/bob
```

Example 2: This example checks to see whether the IAM user Theresa has an MFA device assigned. If one is found, the device is disabled for the IAM user. If the device is virtual, then it is also deleted.

```
$mfa = Get-IAMMFADevice -UserName Theresa
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -
SerialNumber $mfa.SerialNumber }
}
```

- For API details, see DeleteVirtualMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DetachGroupPolicy` with a CLI

The following code examples show how to use `DetachGroupPolicy`.

CLI

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \
    --group-name Testers \
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see DetachGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group named `Testers`.

```
Unregister-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

Example 2: This example finds all the managed policies that are attached to the group named `Testers` and detaches them from the group.

```
Get-IAMAttachedGroupPolicies -GroupName Testers | Unregister-IAMGroupPolicy -
Groupname Testers
```

- For API details, see DetachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group named `Testers`.

```
Unregister-IAMGroupPolicy -GroupName Testers -PolicyArn
 arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

Example 2: This example finds all the managed policies that are attached to the group named `Testers` and detaches them from the group.

```
Get-IAMAttachedGroupPolicies -GroupName Testers | Unregister-IAMGroupPolicy -
Groupname Testers
```

- For API details, see DetachGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DetachRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `DetachRolePolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Manage roles

.NET

Use `DetachUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `DetachUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

CLI

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```
aws iam detach-user-policy \
    --user-name Bob \
    --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the *AWS IAM User Guide*.

- For API details, see DetachUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example detaches the managed policy whose ARN is `arn:aws:iam::123456789012:policy/TesterPolicy` from the IAM user named `Bob`.

```
Unregister-IAMUserPolicy -UserName Bob -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example finds all the managed policies that are attached to the IAM user named `Theresa` and detaches those policies from the user.

```
Get-IAMAttachedUserPolicyList -UserName Theresa | Unregister-IAMUserPolicy -
Username Theresa
```

- For API details, see DetachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example detaches the managed policy whose ARN is `arn:aws:iam::123456789012:policy/TesterPolicy` from the IAM user named `Bob`.

```
Unregister-IAMUserPolicy -UserName Bob -PolicyArn
 arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example finds all the managed policies that are attached to the IAM user named `Theresa` and detaches those policies from the user.

```
Get-IAMAttachedUserPolicyList -UserName Theresa | Unregister-IAMUserPolicy -
Username Theresa
```

- For API details, see DetachUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `EnableMfaDevice` with a CLI

The following code examples show how to use `EnableMfaDevice`.

CLI

AWS CLI

To enable an MFA device

After you use the `create-virtual-mfa-device` command to create a new virtual MFA device, you can assign the MFA device to a user. The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::210987654321:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see EnableMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command enables the hardware MFA device with the serial number 987654321098 and associates the device with the user Bob. It includes the first two codes in sequence from the device.

```
Enable-IAMMFADevice -UserName "Bob" -SerialNumber "987654321098" -
AuthenticationCode1 "12345678" -AuthenticationCode2 "87654321"
```

Example 2: This example creates and enables a virtual MFA device. The first command creates the virtual device and returns the device's object representation in the variable `$MFADevice`. You can use the `.Base32StringSeed` or `QRCodePng` properties to configure the user's software application. The final command assigns the device to the user `David`, identifying the device by its serial number. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
$MFADevice = New-IAMVirtualMFADevice -VirtualMFADeviceName "MyMFADevice"
# see example for New-IAMVirtualMFADevice to see how to configure the software
 program with PNG or base32 seed code
Enable-IAMMFADevice -UserName "David" -SerialNumber -SerialNumber
 $MFADevice.SerialNumber -AuthenticationCode1 "24681357" -AuthenticationCode2
 "13572468"
```

- For API details, see EnableMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command enables the hardware MFA device with the serial number 987654321098 and associates the device with the user Bob. It includes the first two codes in sequence from the device.

```
Enable-IAMMFADevice -UserName "Bob" -SerialNumber "987654321098" -
AuthenticationCode1 "12345678" -AuthenticationCode2 "87654321"
```

Example 2: This example creates and enables a virtual MFA device. The first command creates the virtual device and returns the device's object representation in the variable `$MFADevice`. You can use the `.Base32StringSeed` or `QRCodePng` properties to configure the user's software application. The final command assigns the device to the user `David`, identifying the device by its serial number. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
$MFADevice = New-IAMVirtualMFADevice -VirtualMFADeviceName "MyMFADevice"
# see example for New-IAMVirtualMFADevice to see how to configure the software
 program with PNG or base32 seed code
Enable-IAMMFADevice -UserName "David" -SerialNumber -SerialNumber
 $MFADevice.SerialNumber -AuthenticationCode1 "24681357" -AuthenticationCode2
 "13572468"
```

- For API details, see EnableMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GenerateCredentialReport` with an AWS SDK or CLI

The following code examples show how to use `GenerateCredentialReport`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

CLI

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
    "State":  "STARTED",
    "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GenerateCredentialReport in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example requests generation of a new report, which can be done every four hours. If the last report is still recent the State field reads `COMPLETE`. Use `Get-IAMCredentialReport` to view the completed report.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                     State
-----------                                                     -----
No report exists. Starting a new report generation task         STARTED
```

- For API details, see GenerateCredentialReport in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example requests generation of a new report, which can be done every four hours. If the last report is still recent the State field reads `COMPLETE`. Use `Get-IAMCredentialReport` to view the completed report.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                    State
-----------                                                    -----
No report exists. Starting a new report generation task        STARTED
```

- For API details, see GenerateCredentialReport in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def generate_credential_report():
    """
    Starts generation of a credentials report about the current account. After
    calling this function to generate the report, call get_credential_report
    to get the latest report. A new report can be generated a minimum of four
 hours
    after the last one was generated.
    """
    try:
        response = iam.meta.client.generate_credential_report()
        logger.info(
            "Generating credentials report for your account. " "Current state is
 %s.",
            response["State"],
        )
    except ClientError:
        logger.exception("Couldn't generate a credentials report for your
 account.")
        raise
    else:
        return response
```

- For API details, see GenerateCredentialReport in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GenerateServiceLastAccessedDetails` with a CLI

The following code examples show how to use `GenerateServiceLastAccessedDetails`.

CLI

AWS CLI

Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

Example 2: To generate a service access report for the AWS managed AdministratorAccess policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateServiceLastAccessedDetails in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example is equivalent cmdlet of GenerateServiceLastAccessedDetails API. This provides with a job id which can be used in Get-IAMServiceLastAccessedDetail and Get-IAMServiceLastAccessedDetailWithEntity

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

- For API details, see GenerateServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example is equivalent cmdlet of GenerateServiceLastAccessedDetails API. This provides with a job id which can be used in Get-IAMServiceLastAccessedDetail and Get-IAMServiceLastAccessedDetailWithEntity

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

- For API details, see GenerateServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAccessKeyLastUsed` with an AWS SDK or CLI

The following code examples show how to use `GetAccessKeyLastUsed`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access keys

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::accessKeyLastUsed(const Aws::String &secretKeyID,
                                    const Aws::Client::ClientConfiguration
 &clientConfig) {
   Aws::IAM::IAMClient iam(clientConfig);
   Aws::IAM::Model::GetAccessKeyLastUsedRequest request;

   request.SetAccessKeyId(secretKeyID);

   Aws::IAM::Model::GetAccessKeyLastUsedOutcome outcome =
 iam.GetAccessKeyLastUsed(
           request);

   if (!outcome.IsSuccess()) {
       std::cerr << "Error querying last used time for access key " <<
                 secretKeyID << ":" << outcome.GetError().GetMessage() <<
 std::endl;
   }
   else {
```

```
        Aws::String lastUsedTimeString =
                outcome.GetResult()
                        .GetAccessKeyLastUsed()
                        .GetLastUsedDate()
                        .ToGmtString(Aws::Utils::DateFormat::ISO_8601);
        std::cout << "Access key " << secretKeyID << " last used at time " <<
                  lastUsedTimeString << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetAccessKeyLastUsed in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
    --access-key-id ABCDEXAMPLE
```

Output:

```
{
    "UserName":  "Bob",
    "AccessKeyLastUsed": {
        "Region": "us-east-1",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccessKeyLastUsed in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the access key.

```
import { GetAccessKeyLastUsedCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} accessKeyId
 */
export const getAccessKeyLastUsed = async (accessKeyId) => {
  const command = new GetAccessKeyLastUsedCommand({
    AccessKeyId: accessKeyId,
  });

  const response = await client.send(command);

  if (response.AccessKeyLastUsed?.LastUsedDate) {
    console.log(`
    ${accessKeyId} was last used by ${response.UserName} via
    the ${response.AccessKeyLastUsed.ServiceName} service on
    ${response.AccessKeyLastUsed.LastUsedDate.toISOString()}
    `);
  }

  return response;
};
```

- Manage your account

CLI

AWS CLI

To list an AWS account's IAM users, groups, roles, and policies

The following `get-account-authorization-details` command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
```

```
                "Version":"2012-10-17",

PowerShell

Tools for PowerShell V4

Example 1: This example gets authorization details about the identities in the AWS account, and displays the element list of the returned object, including users, groups, and roles. For example, the `UserDetailList` property displays details about the users. Similar information is available in the `RoleDetailList` and `GroupDetailList` properties.

```
$Details=Get-IAMAccountAuthorizationDetail
```

```
$Details
```

Output:

```
GroupDetailList : {Administrators, Developers, Testers, Backup}
IsTruncated     : False
Marker          :
RoleDetailList  : {TestRole1, AdminRole, TesterRole, clirole...}
UserDetailList  : {Administrator, Bob, BackupToS3, }
```

```
$Details.UserDetailList
```

Output:

```
Arn             : arn:aws:iam::123456789012:user/Administrator
CreateDate      : 10/16/2014 9:03:09 AM
GroupList       : {Administrators}
Path            : /
UserId          : AIDACKCEVSQ6CEXAMPLE1
UserName        : Administrator
UserPolicyList : {}

Arn             : arn:aws:iam::123456789012:user/Bob
CreateDate      : 4/6/2015 12:54:42 PM
GroupList       : {Developers}
Path            : /
UserId          : AIDACKCEVSQ6CEXAMPLE2
UserName        : bab
UserPolicyList : {}

Arn             : arn:aws:iam::123456789012:user/BackupToS3
CreateDate      : 1/27/2015 10:15:08 AM
GroupList       : {Backup}
Path            : /

```

- For API details, see GetAccountAuthorizationDetails in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets authorization details about the identities in the AWS account, and displays the element list of the returned object, including users, groups, and roles. For example, the `UserDetailList` property displays details about the users. Similar information is available in the `RoleDetailList` and `GroupDetailList` properties.

```
$Details=Get-IAMAccountAuthorizationDetail
$Details
```

Output:

```
GroupDetailList : {Administrators, Developers, Testers, Backup}
IsTruncated     : False
Marker          :
RoleDetailList  : {TestRole1, AdminRole, TesterRole, clirole...}
UserDetailList  : {Administrator, Bob, BackupToS3, }
```

```
$Details.UserDetailList
```

Output:

```
Arn             : arn:aws:iam::123456789012:user/Administrator
CreateDate      : 10/16/2014 9:03:09 AM
GroupList       : {Administrators}
Path            : /
UserId          : AIDACKCEVSQ6CEXAMPLE1
UserName        : Administrator
UserPolicyList : {}

Arn             : arn:aws:iam::123456789012:user/Bob
CreateDate      : 4/6/2015 12:54:42 PM
GroupList       : {Developers}
Path            : /
UserId          : AIDACKCEVSQ6CEXAMPLE2
UserName        : bab
UserPolicyList : {}

Arn             : arn:aws:iam::123456789012:user/BackupToS3
CreateDate      : 1/27/2015 10:15:08 AM
```

```
GroupList      : {Backup}
Path           : /
UserId         : AIDACKCEVSQ6CEXAMPLE3
UserName       : BackupToS3
UserPolicyList : {BackupServicePermissionsToS3Buckets}
```

- For API details, see GetAccountAuthorizationDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def get_authorization_details(response_filter):
    """
    Gets an authorization detail report for the current account.

    :param response_filter: A list of resource types to include in the report,
 such
                            as users or roles. When not specified, all resources
                            are included.
    :return: The authorization detail report.
    """
    try:
        account_details = iam.meta.client.get_account_authorization_details(
            Filter=response_filter
        )
        logger.debug(account_details)
    except ClientError:
        logger.exception("Couldn't get details for your account.")
        raise
    else:
        return account_details
```

- For API details, see GetAccountAuthorizationDetails in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAccountPasswordPolicy` with an AWS SDK or CLI

The following code examples show how to use `GetAccountPasswordPolicy`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Gets the IAM password policy for an AWS account.
    /// </summary>
    /// <returns>The PasswordPolicy for the AWS account.</returns>
    public async Task<PasswordPolicy> GetAccountPasswordPolicyAsync()
    {
        var response = await _IAMService.GetAccountPasswordPolicyAsync(new
GetAccountPasswordPolicyRequest());
        return response.PasswordPolicy;
    }
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccountPasswordPolicy in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "log"

 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// AccountWrapper encapsulates AWS Identity and Access Management (IAM) account
 actions
// used in the examples.
// It contains an IAM service client that is used to perform account actions.
type AccountWrapper struct {
 IamClient *iam.Client
}

// GetAccountPasswordPolicy gets the account password policy for the current
 account.
// If no policy has been set, a NoSuchEntityException is error is returned.
func (wrapper AccountWrapper) GetAccountPasswordPolicy(ctx context.Context)
 (*types.PasswordPolicy, error) {
 var pwPolicy *types.PasswordPolicy
 result, err := wrapper.IamClient.GetAccountPasswordPolicy(ctx,
  &iam.GetAccountPasswordPolicyInput{})
 if err != nil {
  log.Printf("Couldn't get account password policy. Here's why: %v\n", err)
 } else {
  pwPolicy = result.PasswordPolicy
 }
 return pwPolicy, err
}
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for Go API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the account password policy.

```
import {
  GetAccountPasswordPolicyCommand,
  IAMClient,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

export const getAccountPasswordPolicy = async () => {
  const command = new GetAccountPasswordPolicyCommand({});

  const response = await client.send(command);
  console.log(response.PasswordPolicy);
  return response;
};
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for JavaScript API Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function getAccountPasswordPolicy()
    {
        return $this->iamClient->getAccountPasswordPolicy();
    }
```

- For API details, see GetAccountPasswordPolicy in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the password policy for the current account. If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

```
Get-IAMAccountPasswordPolicy
```

Output:

```
AllowUsersToChangePassword : True
ExpirePasswords            : True
HardExpiry                 : False
MaxPasswordAge             : 90
MinimumPasswordLength      : 8
PasswordReusePrevention    : 20
RequireLowercaseCharacters : True
RequireNumbers             : True
RequireSymbols             : False
RequireUppercaseCharacters : True
```

- For API details, see GetAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the password policy for the current account. If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

```
Get-IAMAccountPasswordPolicy
```

Output:

```
AllowUsersToChangePassword : True
ExpirePasswords            : True
HardExpiry                 : False
MaxPasswordAge             : 90
MinimumPasswordLength      : 8
PasswordReusePrevention    : 20
RequireLowercaseCharacters : True
RequireNumbers             : True
RequireSymbols             : False
RequireUppercaseCharacters : True
```

- For API details, see GetAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `GetAccountSummary` with an AWS SDK or CLI

The following code examples show how to use `GetAccountSummary`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

CLI

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
    "SummaryMap": {
        "UsersQuota": 5000,
        "GroupsQuota": 100,
        "InstanceProfiles": 6,
        "SigningCertificatesPerUserQuota": 2,
        "AccountAccessKeysPresent": 0,
        "RolesQuota": 250,
        "RolePolicySizeQuota": 10240,
        "AccountSigningCertificatesPresent": 0,
        "Users": 27,
        "ServerCertificatesQuota": 20,
        "ServerCertificates": 0,
        "AssumeRolePolicySizeQuota": 2048,
        "Groups": 7,
        "MFADevicesInUse": 1,
        "Roles": 3,
        "AccountMFAEnabled": 1,
        "MFADevices": 3,
        "GroupsPerUserQuota": 10,
        "GroupPolicySizeQuota": 5120,
        "InstanceProfilesQuota": 100,

InstanceProfiles                        1
...
```

- For API details, see GetAccountSummary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def get_summary():
    """
    Gets a summary of account usage.

    :return: The summary of account usage.
    """
    try:
        summary = iam.AccountSummary()
        logger.debug(summary.summary_map)
    except ClientError:
        logger.exception("Couldn't get a summary for your account.")
        raise
    else:
        return summary.summary_map
```

- For API details, see GetAccountSummary in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetContextKeysForCustomPolicy` with a CLI

The following code examples show how to use `GetContextKeysForCustomPolicy`.

CLI

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands `simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[
    "Policy1",
    "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash \".

```
[ "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow
\", \"Action\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-
west-2:128716708097:table/${aws:username}\", \"Condition\": {\"DateGreaterThan\":
 {\"aws:CurrentTime\": \"2015-08-16T12:00:00Z\"}}}}" ]
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list file://policyfile.json
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForCustomPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches all the context keys present in the provided policy json.In order to provide multiple policies you can provide as comma separated list of values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForCustomPolicy -PolicyInputList $policy1,$policy2
```

- For API details, see GetContextKeysForCustomPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches all the context keys present in the provided policy json.In order to provide multiple policies you can provide as comma separated list of values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForCustomPolicy -PolicyInputList $policy1,$policy2
```

- For API details, see GetContextKeysForCustomPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetContextKeysForPrincipalPolicy` with a CLI

The following code examples show how to use `GetContextKeysForPrincipalPolicy`.

CLI

AWS CLI

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForPrincipalPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches all the context keys present in the provided policy json and the policies attached to IAM entity(user/role etc.). For -PolicyInputList you can provide multiple values list as comma separated values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForPrincipalPolicy -PolicyInputList $policy1,$policy2 -
PolicySourceArn arn:aws:iam::852640994763:user/TestUser
```

- For API details, see GetContextKeysForPrincipalPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches all the context keys present in the provided policy json and the policies attached to IAM entity(user/role etc.). For -PolicyInputList you can provide multiple values list as comma separated values.

```
$policy1 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17",       "Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/"}}'
Get-IAMContextKeysForPrincipalPolicy -PolicyInputList $policy1,$policy2 -
PolicySourceArn arn:aws:iam::852640994763:user/TestUser
```

- For API details, see GetContextKeysForPrincipalPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetCredentialReport` with an AWS SDK or CLI

The following code examples show how to use `GetCredentialReport`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

CLI

AWS CLI

To get a credential report

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
    "GeneratedTime":  "2015-06-17T19:11:50Z",
    "ReportFormat": "text/csv"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GetCredentialReport in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example opens the returned report and outputs it to the pipeline as an array of text lines. The first line is the header with comma-separated column names. Each successive row is the detail row for one user, with each field separated by commas. Before you can view the report, you must generate it with the `Request-IAMCredentialReport` cmdlet. To retrieve the report as a single string, use `-Raw` instead of `-AsTextArray`. The alias `-SplitLines` is also accepted for the `-AsTextArray` switch. For the full list of columns in the output consult the service API reference. Note that if you do not use `-AsTextArray` or `-SplitLines`, then you must extract the text from the `.Content` property using the .NET `StreamReader` class.

```
Request-IAMCredentialReport
```

Output:

```
Description                                                          State
-----------                                                          -----
No report exists. Starting a new report generation task              STARTED
```

```
Get-IAMCredentialReport -AsTextArray
```

Output:

```
 user,arn,user_creation_time,password_enabled,password_last_used,password_last_changed,pa
 root_account,arn:aws:iam::123456789012:root,2014-10-15T16:31:25+00:00,not_supported,2015
A,false,N/A,false,N/A,false,N/A

```

- For API details, see GetCredentialReport in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def get_credential_report():
    """
    Gets the most recently generated credentials report about the current
 account.

    :return: The credentials report.
    """
    try:
        response = iam.meta.client.get_credential_report()
        logger.debug(response["Content"])
    except ClientError:
        logger.exception("Couldn't get credentials report.")
        raise
    else:
        return response["Content"]
```

- For API details, see GetCredentialReport in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetGroup` with a CLI

The following code examples show how to use `GetGroup`.

CLI

AWS CLI

To get an IAM group

This example returns details about the IAM group `Admins`.

```
aws iam get-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-06-16T19:41:48Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    "Users": []
}
```

For more information, see IAM Identities (users, user groups, and roles) in the *AWS IAM User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the IAM group `Testers`, including a collection of all the IAM users that belong to the group.

```
$results = Get-IAMGroup -GroupName "Testers"
$results
```

Output:

```
Group                                    IsTruncated           Marker
     Users
-----                                    -----------           ------
     -----
Amazon.IdentityManagement.Model.Group    False
     {Theresa, David}
```

```
$results.Group
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Testers
CreateDate : 12/10/2014 3:39:11 PM
GroupId    : 3RHNZZGQJ7QHMAEXAMPLE1
GroupName  : Testers
Path       : /
```

```
$results.Users
```

Output:

```
Arn              : arn:aws:iam::123456789012:user/Theresa
CreateDate       : 12/10/2014 3:39:27 PM

PasswordLastUsed : 3/19/2015 8:44:04 AM
Path             : /
UserId           : Y4FKWQCXTA52QEXAMPLE3
UserName         : David
```

- For API details, see GetGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetGroupPolicy` with a CLI

The following code examples show how to use `GetGroupPolicy`.

CLI

AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \
    --group-name Test-Group \
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    },
    "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see GetGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the embedded inline policy named `PowerUserAccess-Testers` for the group `Testers`. The `PolicyDocument` property is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMGroupPolicy -GroupName Testers -PolicyName PowerUserAccess-
Testers
$results
```

Output:

```
GroupName     PolicyDocument
 PolicyName
---------     --------------
 ----------
Testers       %7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%0A%20...
 PowerUserAccess-Testers

[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances"
      ],
      "Resource": [
        "arn:aws:ec2:us-east-1:555555555555:instance/i-b188560f"
      ]
    }
  ]
}
```

- For API details, see GetGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the embedded inline policy named `PowerUserAccess-Testers` for the group `Testers`. The `PolicyDocument` property is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMGroupPolicy -GroupName Testers -PolicyName PowerUserAccess-
Testers
$results
```

Output:

```
GroupName     PolicyDocument
 PolicyName
---------     --------------
 ----------
Testers       %7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%0A%20...
 PowerUserAccess-Testers

[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances"
      ],
      "Resource": [
        "arn:aws:ec2:us-east-1:555555555555:instance/i-b188560f"
      ]
    }
  ]
}
```

- For API details, see GetGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetInstanceProfile` with a CLI

The following code examples show how to use `GetInstanceProfile`.

CLI

AWS CLI

To get information about an instance profile

The following `get-instance-profile` command gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9RO4H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::336924118301:instance-profile/
ExampleInstanceProfile"
    }
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see GetInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details of the instance profile named `ec2instancerole` that is defined in the current AWS account.

```
Get-IAMInstanceProfile -InstanceProfileName ec2instancerole
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see GetInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details of the instance profile named `ec2instancerole` that is defined in the current AWS account.

```
Get-IAMInstanceProfile -InstanceProfileName ec2instancerole
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see GetInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetLoginProfile` with a CLI

The following code examples show how to use `GetLoginProfile`.

CLI

AWS CLI

To get password information for an IAM user

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
    --user-name Bob
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see GetLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the password creation date and whether a password reset is required for the IAM user `David`.

```
Get-IAMLoginProfile -UserName David
```

Output:

```
CreateDate                 PasswordResetRequired              UserName
----------                 ---------------------              --------
12/10/2014 3:39:44 PM      False                              David
```

- For API details, see GetLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the password creation date and whether a password reset is required for the IAM user `David`.

```
Get-IAMLoginProfile -UserName David
```

Output:

```
CreateDate                 PasswordResetRequired              UserName
----------                 ---------------------              --------
12/10/2014 3:39:44 PM      False                              David
```

- For API details, see GetLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetOpenIdConnectProvider` with a CLI

The following code examples show how to use `GetOpenIdConnectProvider`.

CLI

AWS CLI

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Url": "server.example.com"
        "CreateDate": "2015-06-16T19:41:48Z",
        "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
        ],
        "ClientIDList": [
        "example-application-ID"
        ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see GetOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/accounts.google.com`. The `ClientIDList` property is a collection that contains all the Client IDs defined for this provider.

```
Get-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/oidc.example.com
```

Output:

```
ClientIDList         CreateDate               ThumbprintList
           Url
------------         ----------               --------------
           ---
{MyOIDCApp}          2/3/2015 3:00:30 PM
 {12345abcdefghijk67890lmnopqrst98765uvwxy}   oidc.example.com
```

- For API details, see GetOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/accounts.google.com`. The `ClientIDList` property is a collection that contains all the Client IDs defined for this provider.

```
Get-IAMOpenIDConnectProvider -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/oidc.example.com
```

Output:

```
ClientIDList         CreateDate               ThumbprintList
           Url
------------         ----------               --------------
           ---
{MyOIDCApp}          2/3/2015 3:00:30 PM
 {12345abcdefghijk67890lmnopqrst98765uvwxy}   oidc.example.com
```

- For API details, see GetOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPolicy` with an AWS SDK or CLI

The following code examples show how to use `GetPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Work with the IAM Policy Builder API

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information about an IAM policy.
    /// </summary>
    /// <param name="policyArn">The IAM policy to retrieve information for.</
param>
    /// <returns>The IAM policy.</returns>
    public async Task<ManagedPolicy> GetPolicyAsync(string policyArn)
    {

        var response = await _IAMService.GetPolicyAsync(new GetPolicyRequest
 { PolicyArn = policyArn });
        return response.Policy;
    }
```

- For API details, see GetPolicy in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**

Use `GetPolicyVersion` with an AWS SDK or CLI

The following code examples show how to use `GetPolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Work with the IAM Policy Builder API

CLI

AWS CLI

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

Output:

```
{
    "PolicyVersion": {
        "Document": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Action": "iam:*",
                    "Resource": "*"
                }
            ]
        },
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2023-04-11T00:22:54+00:00"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. The policy

document in the `Document` property is URL encoded and is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy -VersionId v2
$results
```

Output:

```
CreateDate             Document

        policy = iam.Policy(policy_arn)
        # To get an attribute of a policy, the SDK first calls get_policy.
        policy_doc = policy.default_version.document
        policy_statement = policy_doc.get("Statement", None)
        logger.info("Got default policy doc for %s.", policy.policy_name)
        logger.info(policy_doc)
    except ClientError:
        logger.exception("Couldn't get default policy statement for %s.",
 policy_arn)
        raise
    else:
        return policy_statement
```

- For API details, see GetPolicyVersion in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetRole` with an AWS SDK or CLI

The following code examples show how to use `GetRole`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information about an IAM role.
    /// </summary>
    /// <param name="roleName">The name of the IAM role to retrieve information
    /// for.</param>
    /// <returns>The IAM role that was retrieved.</returns>
    public async Task<Role> GetRoleAsync(string roleName)
    {
        var response = await _IAMService.GetRoleAsync(new GetRoleRequest
        {
            RoleName = roleName,
        });

        return response.Role;
    }
```

- For API details, see GetRole in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To get information about an IAM role

The following `get-role` command gets information about the role named `Test-Role`.

```
aws iam get-role \
    --role-name Test-Role
```

Output:

```
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument":"<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
            "Region": "us-east-1",
            "LastUsedDate": "2019-11-13T17:14:00Z"
        },
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRole in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the role.

```
import { GetRoleCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} roleName
 */
export const getRole = (roleName) => {
  const command = new GetRoleCommand({
    RoleName: roleName,
  });

  return client.send(command);
};
```

- For API details, see GetRole in *AWS SDK for JavaScript API Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function getRole($roleName)
    {
        return $this->customWaiter(function () use ($roleName) {
            return $this->iamClient->getRole(['RoleName' => $roleName]);
        });
    }
```

- For API details, see GetRole in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the details of the `lamda_exec_role`. It includes the trust policy document that specifies who can assume this role. The policy document is URL encoded and can be decoded using the .NET `UrlDecode` method. In this example, the original policy had all white space removed before it was uploaded to the policy. To see the permissions policy documents that determine what someone who assumes the role can do, use the `Get-IAMRolePolicy` for inline policies, and `Get-IAMPolicyVersion` for attached managed policies.

```
$results = Get-IamRole -RoleName lambda_exec_role
$results | Format-List
```

Output:

```
Arn                       : arn:aws:iam::123456789012:role/lambda_exec_role
AssumeRolePolicyDocument  : %7B%22Version%22%3A%222012-10-17%22%2C%22Statement

Use `GetRolePolicy` with a CLI

The following code examples show how to use `GetRolePolicy`.

CLI

AWS CLI

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

Output:

```
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
      "Statement": [
          {
              "Action": [
                  "s3:ListBucket",
                  "s3:Put*",
                  "s3:Get*",
                  "s3:*MultipartUpload*"
              ],
              "Resource": "*",
              "Effect": "Allow",
              "Sid": "1"
          }
      ]
  }
  "PolicyName": "ExamplePolicy"
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRolePolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the permissions policy document for the policy named one`Click_lambda_exec_role_policy` that is embedded in the IAM role `lamda_exec_role`. The resulting policy document is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = Get-IAMRolePolicy -RoleName lambda_exec_role -PolicyName
 oneClick_lambda_exec_role_policy
$results
```

Output:

```
PolicyDocument                                          PolicyName
              UserName
--------------                                          ----------
              --------
%7B%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%...
 oneClick_lambda_exec_role_policy     lambda_exec_role
```

```
[System.Reflection.Assembly]::LoadWithPartialName("System.Web.HttpUtility")
[System.Web.HttpUtility]::UrlDecode($results.PolicyDocument)
```

Output:

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "logs:*"
      ],
      "Resource": "arn:aws:logs:us-east-1:555555555555:log-group:/aws/lambda/aws-
example-function:*"
    },
    {
      "Effect": "Allow",
      "Action": [
```

```
        "s3:GetObject",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::amzn-s3-demo-bucket/*"
      ]
    }
  ]
}
```

- For API details, see GetRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the permissions policy document for the policy named oneClick_lambda_exec_role_policy that is embedded in the IAM role lamda_exec_role. The resulting policy document is URL encoded. It is decoded in this example with the UrlDecode .NET method.

```
$results = Get-IAMRolePolicy -RoleName lambda_exec_role -PolicyName
 oneClick_lambda_exec_role_policy
$results
```

Output:

```
PolicyDocument                                                  PolicyName
              UserName
--------------                                                  ----------

Use `GetSamlProvider` with a CLI

The following code examples show how to use `GetSamlProvider`.

CLI

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARM is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see GetSamlProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
Get-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS
```

Output:

```
CreateDate                SAMLMetadataDocument
        ValidUntil
----------                --------------------
        ----------
```

```
12/23/2014 12:16:55 PM    <EntityDescriptor ID="_12345678-1234-5678-9012-
example1...    12/23/2114 12:16:54 PM
```

- For API details, see GetSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
Get-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS
```

Output:

```
CreateDate                 SAMLMetadataDocument
        ValidUntil
----------                 --------------------
        ----------
12/23/2014 12:16:55 PM    <EntityDescriptor ID="_12345678-1234-5678-9012-
example1...    12/23/2114 12:16:54 PM
```

- For API details, see GetSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `GetServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `GetServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::getServerCertificate(const Aws::String &certificateName,
                                       const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::GetServerCertificateRequest request;
    request.SetServerCertificateName(certificateName);

    auto outcome = iam.GetServerCertificate(request);
    bool result = true;
    if (!outcome.IsSuccess()) {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error getting server certificate " << certificateName
 <<
                      ": " << outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << certificateName
                      << "' not found." << std::endl;
        }
    }
    else {
        const auto &certificate = outcome.GetResult().GetServerCertificate();
        std::cout << "Name: " <<

 certificate.GetServerCertificateMetadata().GetServerCertificateName()
                  << std::endl << "Body: " << certificate.GetCertificateBody() <<
                  std::endl << "Chain: " << certificate.GetCertificateChain() <<
                  std::endl;
    }
```

```
    return result;
}
```

- For API details, see GetServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To get details about a server certificate in your AWS account

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see GetServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get a server certificate.

```
import { GetServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";
```

```
const client = new IAMClient({});

/**
 *
 * @param {string} certName
 * @returns
 */
export const getServerCertificate = async (certName) => {
  const command = new GetServerCertificateCommand({
    ServerCertificateName: certName,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

iam.getServerCertificate(
  { ServerCertificateName: "CERTIFICATE_NAME" },
  function (err, data) {
    if (err) {
```

```
      console.log("Error", err);
    } else {
      console.log("Success", data);
    }
  }
);
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves details about the server certificate named `MyServerCertificate`. You can find the certificate details in the `CertificateBody` and `ServerCertificateMetadata` properties.

```
$result = Get-IAMServerCertificate -ServerCertificateName MyServerCertificate
$result | format-list
```

Output:

```

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLastAccessedDetails` with a CLI

The following code examples show how to use `GetServiceLastAccessedDetails`.

CLI

AWS CLI

To retrieve a service access report

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
    --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:50:35.929Z",
    "ServicesLastAccessed": [
        ...
        {
            "ServiceName": "AWS Lambda",
            "LastAuthenticated": "2019-09-30T23:02:00Z",
            "ServiceNamespace": "lambda",
            "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
            "TotalAuthenticatedEntities": 6
        },
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetails in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides details of the service last accessed by the IAM entity(user, group, role or policy) associated in Request call.

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

Output:

```
f0b7a819-eab0-929b-dc26-ca598911cb9f
```

```
Get-IAMServiceLastAccessedDetail -JobId f0b7a819-eab0-929b-dc26-ca598911cb9f
```

- For API details, see GetServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example provides details of the service last accessed by the IAM entity(user, group, role or policy) associated in Request call.

```
Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
```

Output:

```
f0b7a819-eab0-929b-dc26-ca598911cb9f
```

```
Get-IAMServiceLastAccessedDetail -JobId f0b7a819-eab0-929b-dc26-ca598911cb9f
```

- For API details, see GetServiceLastAccessedDetails in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLastAccessedDetailsWithEntities` with a CLI

The following code examples show how to use `GetServiceLastAccessedDetailsWithEntities`.

CLI

AWS CLI

To retrieve a service access report with details for a service

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
    --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
    --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
```

```
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/developer",
                "Name": "developer",
                "Type": "USER",
                "Id": "AIDAIBEYXMPL2YEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides the last accessed timestamp for the service in the request by that respective IAM entity.

```
$results = Get-IAMServiceLastAccessedDetailWithEntity -JobId f0b7a819-eab0-929b-
dc26-ca598911cb9f -ServiceNamespace ec2
$results
```

Output:

```
EntityDetailsList : {Amazon.IdentityManagement.Model.EntityDetails}
Error             :
IsTruncated       : False
JobCompletionDate : 12/29/19 11:19:31 AM
JobCreationDate   : 12/29/19 11:19:31 AM

JobCompletionDate : 12/29/19 11:19:31 AM
JobCreationDate   : 12/29/19 11:19:31 AM
JobStatus         : COMPLETED
Marker            :
```

```
$results.EntityDetailsList
```

Output:

```
EntityInfo                                    LastAuthenticated
----------                                    -----------------
Amazon.IdentityManagement.Model.EntityInfo 11/16/19 3:47:00 PM
```

```
$results.EntityInfo
```

Output:

```
Arn  : arn:aws:iam::123456789012:user/TestUser
Id   : AIDA4NBK5CXF5TZHU1234
Name : TestUser
Path : /
Type : USER
```

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetServiceLinkedRoleDeletionStatus` with an AWS SDK or CLI

The following code examples show how to use `GetServiceLinkedRoleDeletionStatus`.

CLI

AWS CLI

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
```

```
    --deletion-task-id task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
"Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import {
  GetServiceLinkedRoleDeletionStatusCommand,
  IAMClient,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} deletionTaskId
 */
export const getServiceLinkedRoleDeletionStatus = (deletionTaskId) => {
  const command = new GetServiceLinkedRoleDeletionStatusCommand({
    DeletionTaskId: deletionTaskId,
  });

  return client.send(command);
};
```

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS SDK for JavaScript API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetUser` with an AWS SDK or CLI

The following code examples show how to use `GetUser`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get information about an IAM user.
    /// </summary>
    /// <param name="userName">The username of the user.</param>
    /// <returns>An IAM user object.</returns>
    public async Task<User> GetUserAsync(string userName)
    {
        var response = await _IAMService.GetUserAsync(new GetUserRequest
{ UserName = userName });
        return response.User;
    }
```

- For API details, see GetUser in *AWS SDK for .NET API Reference*.

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
##############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

##############################################################################
# function iam_user_exists
#
# This function checks to see if the specified AWS Identity and Access Management
 (IAM) user already exists.
#
# Parameters:
#       $1 - The name of the IAM user to check.
#
# Returns:
#       0 - If the user already exists.
#       1 - If the user doesn't exist.
##############################################################################
function iam_user_exists() {
  local user_name
  user_name=$1

  # Check whether the IAM user already exists.
  # We suppress all output - we're interested only in the return code.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves details about the user named `David`.

```
Get-IAMUser -UserName David
```

Output:

```
Arn              : arn:aws:iam::123456789012:user/David
CreateDate       : 12/10/2014 3:39:27 PM
PasswordLastUsed : 3/19/2015 8:44:04 AM
Path             : /
UserId           : Y4FKWQCXTA52QEXAMPLE1
UserName         : David
```

Example 2: This example retrieves details about the currently signed-in IAM user.

```
Get-IAMUser
```

Output:

```
Arn              : arn:aws:iam::123456789012:user/Bob
CreateDate       : 10/16/2014 9:03:09 AM
PasswordLastUsed : 3/4/2015 12:12:33 PM
Path             : /
UserId           : 7K3GJEANSKZF2EXAMPLE2
UserName         : Bob
```

- For API details, see GetUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves details about the user named `David`.

```
Get-IAMUser -UserName David
```

Output:

```
Arn              : arn:aws:iam::123456789012:user/David
CreateDate       : 12/10/2014 3:39:27 PM
PasswordLastUsed : 3/19/2015 8:44:04 AM
Path             : /

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
```

```
import AWSS3

    public func getUser(name: String? = nil) async throws -> IAMClientTypes.User
 {
        let input = GetUserInput(
            userName: name
        )
        do {
            let output = try await iamClient.getUser(input: input)
            guard let user = output.user else {
                throw ServiceHandlerError.noSuchUser
            }
            return user
        } catch {
            print("ERROR: getUser:", dump(error))
            throw error
        }
    }
```

- For API details, see GetUser in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetUserPolicy` with a CLI

The following code examples show how to use `GetUserPolicy`.

CLI

AWS CLI

To list policy details for an IAM user

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \
    --user-name Bob \
```

```
    --policy-name ExamplePolicy
```

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version":"2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetUserPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the details of the inline policy named `Davids_IAM_Admin_Policy` that is embedded in the IAM user named `David`. The policy document is URL encoded.

```
$results = Get-IAMUserPolicy -PolicyName Davids_IAM_Admin_Policy -UserName David
$results
```

Output:

```
PolicyDocument                                          PolicyName
       UserName

        const Aws::String DATE_FORMAT = "%Y-%m-%d";

        for (const auto &key: keys) {
            Aws::String statusString =
                    Aws::IAM::Model::StatusTypeMapper::GetNameForStatusType(
                            key.GetStatus());
            std::cout << std::left << std::setw(32) << key.GetUserName() <<
```

```
                        std::setw(30) << key.GetAccessKeyId() << std::setw(20) <<
                        statusString << std::setw(20) <<
                        key.GetCreateDate().ToGmtString(DATE_FORMAT.c_str()) <<
 std::endl;
        }

        if (outcome.GetResult().GetIsTruncated()) {
            request.SetMarker(outcome.GetResult().GetMarker());
        }
        else {
            done = true;
        }
    }

    return true;
}
```

- For API details, see ListAccessKeys in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
    "AccessKeyMetadata": [
        {
            "UserName": "Bob",
            "Status": "Active",
            "CreateDate": "2013-06-04T18:17:34Z",
            "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
        },
```

```
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CreateDate": "2013-06-06T20:42:26Z",
            "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
        }
    ]
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see ListAccessKeys in *AWS CLI Command Reference*.

```
suspend fun listKeys(userNameVal: String?) {
    val request =
        ListAccessKeysRequest {
            userName = userNameVal
        }
    IamClient.fromEnvironment { region = "AWS_GLOBAL" }.use { iamClient ->
        val response = iamClient.listAccessKeys(request)
        response.accessKeyMetadata?.forEach { md ->
            println("Retrieved access key ${md.accessKeyId}")
        }
    }
}
```

- For API details, see ListAccessKeys in *AWS SDK for Kotlin API reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command lists the access keys for the IAM user named Bob. Note that you cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys with the `New-IAMAccessKey` cmdlet.

```
Get-IAMAccessKey -UserName "Bob"
```

Output:

```
AccessKeyId               CreateDate                 Status
 UserName
-----------               ----------                 ------
 --------
AKIAIOSFODNN7EXAMPLE      12/3/2014 10:53:41 AM      Active             Bob
AKIAI44QH8DHBEXAMPLE      6/6/2013 8:42:26 PM        Inactive           Bob
```

- For API details, see ListAccessKeys in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command lists the access keys for the IAM user named Bob. Note that you cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys with the `New-IAMAccessKey` cmdlet.

```
Get-IAMAccessKey -UserName "Bob"
```

Output:

```
AccessKeyId               CreateDate                 Status
 UserName
-----------               ----------                 ------
 --------
AKIAIOSFODNN7EXAMPLE      12/3/2014 10:53:41 AM      Active             Bob

Use `ListAccountAliases` with an AWS SDK or CLI

The following code examples show how to use `ListAccountAliases`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage your account

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool
AwsDoc::IAM::listAccountAliases(const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::ListAccountAliasesRequest request;

    bool done = false;
    bool header = false;
    while (!done) {
        auto outcome = iam.ListAccountAliases(request);
        if (!outcome.IsSuccess()) {
            std::cerr << "Failed to list account aliases: " <<
                      outcome.GetError().GetMessage() << std::endl;
            return false;
        }

        const auto &aliases = outcome.GetResult().GetAccountAliases();
        if (!header) {
            if (aliases.size() == 0) {
                std::cout << "Account has no aliases" << std::endl;
                break;
            }
            std::cout << std::left << std::setw(32) << "Alias" << std::endl;
            header = true;
        }

        for (const auto &alias: aliases) {
            std::cout << std::left << std::setw(32) << alias << std::endl;
        }

        if (outcome.GetResult().GetIsTruncated()) {
            request.SetMarker(outcome.GetResult().GetMarker());
```

```
        }
        else {
            done = true;
        }
    }

    return true;
}
```

- For API details, see ListAccountAliases in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To list account aliases

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{
    "AccountAliases": [
    "mycompany"
    ]
}
```

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see ListAccountAliases in *AWS CLI Command Reference*.

Use `ListAttachedGroupPolicies` with a CLI

The following code examples show how to use `ListAttachedGroupPolicies`.

CLI

AWS CLI

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \
    --group-name Admins
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedGroupPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account. To see the list of inline policies embedded in the group, use the `Get-IAMGroupPolicyList` command.

```
Get-IAMAttachedGroupPolicyList -GroupName "Admins"
```

Output:

```
PolicyArn                                                PolicyName
---------                                                ----------
arn:aws:iam::aws:policy/SecurityAudit                    SecurityAudit
```

```
arn:aws:iam::aws:policy/AdministratorAccess                AdministratorAccess
```

- For API details, see ListAttachedGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account. To see the list of inline policies embedded in the group, use the `Get-IAMGroupPolicyList` command.

```
Get-IAMAttachedGroupPolicyList -GroupName "Admins"
```

Output:

```
PolicyArn                                                  PolicyName
---------                                                  ----------
arn:aws:iam::aws:policy/SecurityAudit                      SecurityAudit
arn:aws:iam::aws:policy/AdministratorAccess                AdministratorAccess
```

- For API details, see ListAttachedGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAttachedRolePolicies` with an AWS SDK or CLI

The following code examples show how to use `ListAttachedRolePolicies`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List the IAM role policies that are attached to an IAM role.
    /// </summary>
    /// <param name="roleName">The IAM role to list IAM policies for.</param>
    /// <returns>A list of the IAM policies attached to the IAM role.</returns>
    public async Task<List<AttachedPolicyType>>
ListAttachedRolePoliciesAsync(string roleName)
    {
        var attachedPolicies = new List<AttachedPolicyType>();
        var attachedRolePoliciesPaginator =
_IAMService.Paginators.ListAttachedRolePolicies(new
ListAttachedRolePoliciesRequest { RoleName = roleName });

        await foreach (var response in attachedRolePoliciesPaginator.Responses)
        {
            attachedPolicies.AddRange(response.AttachedPolicies);
        }

        return attachedPolicies;
    }
```

- For API details, see ListAttachedRolePolicies in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```
aws iam list-attached-role-policies \
    --role-name SecurityAuditRole
```

Output:

```
{
    "AttachedPolicies": [
```

```
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedRolePolicies in *AWS CLI Command Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function listAttachedRolePolicies($roleName, $pathPrefix = "", $marker
 = "", $maxItems = 0)
    {
        $listAttachRolePoliciesArguments = ['RoleName' => $roleName];
        if ($pathPrefix) {
            $listAttachRolePoliciesArguments['PathPrefix'] = $pathPrefix;
        }
        if ($marker) {
            $listAttachRolePoliciesArguments['Marker'] = $marker;
        }
        if ($maxItems) {
            $listAttachRolePoliciesArguments['MaxItems'] = $maxItems;
        }
        return $this->iamClient-
>listAttachedRolePolicies($listAttachRolePoliciesArguments);
    }
```

- For API details, see ListAttachedRolePolicies in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account. To see the list of inline policies that are embedded in the role, use the `Get-IAMRolePolicyList` command.

```
Get-IAMAttachedRolePolicyList -RoleName "SecurityAuditRole"
```

Output:

```
PolicyArn                                                 PolicyName
---------                                                 ----------
arn:aws:iam::aws:policy/SecurityAudit                     SecurityAudit
```

- For API details, see ListAttachedRolePolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account. To see the list of inline policies that are embedded in the role, use the `Get-IAMRolePolicyList` command.

```
Get-IAMAttachedRolePolicyList -RoleName "SecurityAuditRole"
```

Output:

```
PolicyArn                                                 PolicyName
---------                                                 ----------
arn:aws:iam::aws:policy/SecurityAudit                     SecurityAudit
```

Use `ListAttachedUserPolicies` with a CLI

The following code examples show how to use `ListAttachedUserPolicies`.

CLI

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
    --user-name Bob
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedUserPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account. To see the list of inline policies that are embedded in the IAM user, use the `Get-IAMUserPolicyList` command.

```
Get-IAMAttachedUserPolicyList -UserName "Bob"
```

Output:

```
PolicyArn                                                PolicyName
---------                                                ----------
```

```
arn:aws:iam::aws:policy/TesterPolicy                    TesterPolicy
```

- For API details, see ListAttachedUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account. To see the list of inline policies that are embedded in the IAM user, use the `Get-IAMUserPolicyList` command.

```
Get-IAMAttachedUserPolicyList -UserName "Bob"
```

Output:

```
PolicyArn                                                PolicyName
---------                                                ----------
arn:aws:iam::aws:policy/TesterPolicy                     TesterPolicy
```

- For API details, see ListAttachedUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListEntitiesForPolicy` with a CLI

The following code examples show how to use `ListEntitiesForPolicy`.

CLI

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
```

```
    --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
    "PolicyGroups": [
        {
            "GroupName": "Admins",
            "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyUsers": [
        {
            "UserName": "Alice",
            "UserId": "AIDACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyRoles": [
        {
            "RoleName": "DevRole",
            "RoleId": "AROADBQP57FF2AEXAMPLE"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListEntitiesForPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
Get-IAMEntitiesForPolicy -PolicyArn "arn:aws:iam::123456789012:policy/TestPolicy"
```

Output:

```
IsTruncated  : False
```

```
Marker       :
PolicyGroups : {}
PolicyRoles  : {testRole}
PolicyUsers  : {Bob, Theresa}
```

- For API details, see ListEntitiesForPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
Get-IAMEntitiesForPolicy -PolicyArn "arn:aws:iam::123456789012:policy/TestPolicy"
```

Output:

```
IsTruncated  : False
Marker       :
PolicyGroups : {}
PolicyRoles  : {testRole}
PolicyUsers  : {Bob, Theresa}
```

- For API details, see ListEntitiesForPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListGroupPolicies` with a CLI

The following code examples show how to use `ListGroupPolicies`.

CLI

AWS CLI

To list all inline policies that are attached to the specified group

The following `list-group-policies` command lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
```

```
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see ListGroupPolicies in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of the inline policies that are embedded in the group `Testers`. To get the managed policies that are attached to the group, use the command `Get-IAMAttachedGroupPolicyList`.

```
Get-IAMGroupPolicyList -GroupName Testers
```

Output:

```
Deny-Assume-S3-Role-In-Production
PowerUserAccess-Testers
```

- For API details, see ListGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of the inline policies that are embedded in the group `Testers`. To get the managed policies that are attached to the group, use the command `Get-IAMAttachedGroupPolicyList`.

```
Get-IAMGroupPolicyList -GroupName Testers
```

Output:

```
Deny-Assume-S3-Role-In-Production
PowerUserAccess-Testers
```

- For API details, see ListGroupPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListGroups` with an AWS SDK or CLI

The following code examples show how to use `ListGroups`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM groups.
    /// </summary>
    /// <returns>A list of IAM groups.</returns>
    public async Task<List<Group>> ListGroupsAsync()
    {
        var groupsPaginator = _IAMService.Paginators.ListGroups(new
ListGroupsRequest());
        var groups = new List<Group>();

        await foreach (var response in groupsPaginator.Responses)
        {
            groups.AddRange(response.Groups);
        }
```

```
        return groups;
    }
```

- For API details, see ListGroups in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the IAM groups for the current account

The following `list-groups` command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-06-04T20:27:27.972Z",
            "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        {
            "Path": "/",
            "CreateDate": "2013-04-16T20:30:42Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
            "GroupName": "S3-Admins"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

Use `ListGroupsForUser` with a CLI

The following code examples show how to use `ListGroupsForUser`.

CLI

AWS CLI

To list the groups that an IAM user belongs to

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }
```

```
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroupsForUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the list of IAM groups that the IAM user `David` belongs to.

```
Get-IAMGroupForUser -UserName David
```

Output:

```
Arn        : arn:aws:iam::123456789012:group/Administrators
CreateDate : 10/20/2014 10:06:24 AM

PowerShell

Tools for PowerShell V4

Example 1: This example returns a collection of the instance profiles defined in the current AWS account.

```
Get-IAMInstanceProfileList
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
```

```
Roles                : {ec2instancerole}
```

- For API details, see ListInstanceProfiles in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a collection of the instance profiles defined in the current AWS account.

```
Get-IAMInstanceProfileList
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
CreateDate          : 2/17/2015 2:49:04 PM
InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
InstanceProfileName : ec2instancerole
Path                : /
Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfiles in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListInstanceProfilesForRole` with a CLI

The following code examples show how to use `ListInstanceProfilesForRole`.

CLI

AWS CLI

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```

Output:

```
{
    "InstanceProfiles": [
        {
            "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
            "Roles": [
                {
                    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                    "CreateDate": "2013-06-07T20:42:15Z",
                    "RoleName": "Test-Role",
                    "Path": "/",
                    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
                }
            ],
            "CreateDate": "2013-06-07T21:05:24Z",
            "InstanceProfileName": "ExampleInstanceProfile",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfilesForRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details of the instance profile associated with the role `ec2instancerole`.

```
Get-IAMInstanceProfileForRole -RoleName ec2instancerole
```

Output:

```
      Arn                 : arn:aws:iam::123456789012:instance-profile/
ec2instancerole
```

```
      CreateDate          : 2/17/2015 2:49:04 PM
      InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
      InstanceProfileName : ec2instancerole
      Path                : /
      Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfilesForRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details of the instance profile associated with the role `ec2instancerole`.

```
Get-IAMInstanceProfileForRole -RoleName ec2instancerole
```

Output:

```
      Arn                 : arn:aws:iam::123456789012:instance-profile/
ec2instancerole
      CreateDate          : 2/17/2015 2:49:04 PM
      InstanceProfileId   : HH36PTZQJUR32EXAMPLE1
      InstanceProfileName : ec2instancerole
      Path                : /
      Roles               : {ec2instancerole}
```

- For API details, see ListInstanceProfilesForRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `ListMfaDevices` with a CLI

The following code examples show how to use `ListMfaDevices`.

CLI

AWS CLI

To list all MFA devices for a specified user

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
    --user-name Bob
```

Output:

```
{
    "MFADevices": [
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
            "EnableDate": "2019-10-28T20:37:09+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "GAKT12345678",
            "EnableDate": "2023-02-18T21:44:42+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
            "EnableDate": "2023-09-19T02:25:35+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
            "EnableDate": "2023-09-19T01:49:18+00:00"
        }
    ]
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ListMfaDevices in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns details about the MFA device assigned to the IAM user `David`. In this example you can tell that it is a virtual device because the `SerialNumber` is an ARN instead of a physical device's actual serial number.

```
Get-IAMMFADevice -UserName David
```

Output:

```
EnableDate                SerialNumber                            UserName
----------                ------------                            --------
4/8/2015 9:41:10 AM       arn:aws:iam::123456789012:mfa/David     David
```

- For API details, see ListMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns details about the MFA device assigned to the IAM user `David`. In this example you can tell that it is a virtual device because the `SerialNumber` is an ARN instead of a physical device's actual serial number.

```
Get-IAMMFADevice -UserName David
```

Output:

```
EnableDate                SerialNumber                            UserName
----------                ------------                            --------
4/8/2015 9:41:10 AM       arn:aws:iam::123456789012:mfa/David     David
```

- For API details, see ListMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListOpenIdConnectProviders` with a CLI

The following code examples show how to use `ListOpenIdConnectProviders`.

CLI

AWS CLI

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviders in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
Get-IAMOpenIDConnectProviderList
```

Output:

```
Arn
---
```

```
arn:aws:iam::123456789012:oidc-provider/server.example.com
arn:aws:iam::123456789012:oidc-provider/another.provider.com
```

- For API details, see ListOpenIdConnectProviders in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
Get-IAMOpenIDConnectProviderList
```

Output:

```
Arn
---
arn:aws:iam::123456789012:oidc-provider/server.example.com
arn:aws:iam::123456789012:oidc-provider/another.provider.com
```

- For API details, see ListOpenIdConnectProviders in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListPolicies` with an AWS SDK or CLI

The following code examples show how to use `ListPolicies`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage policies

.NET

SDK for .NET

> **Note**

                }

                for policy in policies {
                    guard let name = policy.policyName,
                          let id = policy.policyId,
                          let arn = policy.arn
                    else {
                        throw ServiceHandlerError.noSuchPolicy
                    }
                    policyList.append(MyPolicyRecord(name: name, id: id, arn:
 arn))
                }
            }
        } catch {
            print("ERROR: listPolicies:", dump(error))
```

```
            throw error
        }

        return policyList
    }
```

- For API details, see ListPolicies in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListPolicyVersions` with a CLI

The following code examples show how to use `ListPolicyVersions`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Roll back a policy version

CLI

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "IsTruncated": false,
    "Versions": [
```

```
        {
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2015-06-02T23:19:44Z"
        },
        {
        "VersionId": "v1",
        "IsDefaultVersion": false,
        "CreateDate": "2015-06-02T22:30:47Z"
        }
    ]
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. To get the policy document for a specific version, use the `Get-IAMPolicyVersion` command and specify the `VersionId` of the one you want.

```
Get-IAMPolicyVersionList -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy
```

Output:

```
CreateDate                Document                IsDefaultVersion
       VersionId
----------                --------                ----------------
       ---------
2/12/2015 9:39:53 AM                              True
       v2
2/12/2015 9:39:09 AM                              False
       v1
```

- For API details, see ListPolicyVersions in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`. To get the policy document for a specific version, use the `Get-IAMPolicyVersion` command and specify the `VersionId` of the one you want.

```
Get-IAMPolicyVersionList -PolicyArn arn:aws:iam::123456789012:policy/
MyManagedPolicy
```

Output:

```
CreateDate                    Document                IsDefaultVersion
       VersionId
----------                    --------                ----------------
       ---------
2/12/2015 9:39:53 AM                                  True
       v2
2/12/2015 9:39:09 AM                                  False
       v1
```

- For API details, see ListPolicyVersions in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListRolePolicies` with an AWS SDK or CLI

The following code examples show how to use `ListRolePolicies`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM role policies.
    /// </summary>
    /// <param name="roleName">The IAM role for which to list IAM policies.</
param>
    /// <returns>A list of IAM policy names.</returns>
    public async Task<List<string>> ListRolePoliciesAsync(string roleName)
    {
        var listRolePoliciesPaginator =
 _IAMService.Paginators.ListRolePolicies(new ListRolePoliciesRequest { RoleName =
 roleName });
        var policyNames = new List<string>();

        await foreach (var response in listRolePoliciesPaginator.Responses)
        {
            policyNames.AddRange(response.PolicyNames);
        }

        return policyNames;
    }
```

- For API details, see ListRolePolicies in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
```

```
        "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRolePolicies in *AWS CLI Command Reference*.

Go

SDK for Go V2

 } else {
  policies = result.PolicyNames
 }
 return policies, err
}
```

- For API details, see ListRolePolicies in *AWS SDK for Go API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

List the policies.

```
import { ListRolePoliciesCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 * A generator function that handles paginated results.
 * The AWS SDK for JavaScript (v3) provides {@link https://docs.aws.amazon.com/
AWSJavaScriptSDK/v3/latest/index.html#paginators | paginator} functions to
 simplify this.
```

```
 *
 * @param {string} roleName
 */
export async function* listRolePolicies(roleName) {
  const command = new ListRolePoliciesCommand({
    RoleName: roleName,
    MaxItems: 10,
  });

  let response = await client.send(command);

  while (response.PolicyNames?.length) {
    for (const policyName of response.PolicyNames) {
      yield policyName;
    }

    if (response.IsTruncated) {
      response = await client.send(
        new ListRolePoliciesCommand({
          RoleName: roleName,
          MaxItems: 10,
          Marker: response.Marker,
        }),
      );
    } else {
      break;
    }
  }
}
```

- For API details, see ListRolePolicies in *AWS SDK for JavaScript API Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function listRolePolicies($roleName, $marker = "", $maxItems = 0)
    {
        $listRolePoliciesArguments = ['RoleName' => $roleName];
        if ($marker) {

Use `ListRoleTags` with a CLI

The following code examples show how to use `ListRoleTags`.

CLI

AWS CLI

To list the tags attached to a role

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListRoleTags in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches the tag associated with the role..

```
Get-IAMRoleTagList -RoleName MyRoleName
```

- For API details, see ListRoleTags in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches the tag associated with the role..

```
Get-IAMRoleTagList -RoleName MyRoleName
```

- For API details, see ListRoleTags in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListRoles` with an AWS SDK or CLI

The following code examples show how to use `ListRoles`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List IAM roles.
    /// </summary>
    /// <returns>A list of IAM roles.</returns>
    public async Task<List<Role>> ListRolesAsync()
    {
        var listRolesPaginator = _IAMService.Paginators.ListRoles(new
ListRolesRequest());
        var roles = new List<Role>();

        await foreach (var response in listRolesPaginator.Responses)
        {
            roles.AddRange(response.Roles);
        }

        return roles;
    }
```

- For API details, see ListRoles in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list IAM roles for the current account

The following `list-roles` command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
    "Roles": [
        {
            "Path": "/",

Use `ListSAMLProviders` with an AWS SDK or CLI

The following code examples show how to use `ListSAMLProviders`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// List SAML authentication providers.
    /// </summary>
    /// <returns>A list of SAML providers.</returns>
    public async Task<List<SAMLProviderListEntry>> ListSAMLProvidersAsync()
    {
        var response = await _IAMService.ListSAMLProvidersAsync(new
ListSAMLProvidersRequest());
        return response.SAMLProviderList;
    }
```

- For API details, see ListSAMLProviders in *AWS SDK for .NET API Reference*.

CLI

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
            "ValidUntil": "2015-06-05T22:45:14Z",
            "CreateDate": "2015-06-05T22:45:14Z"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see ListSAMLProviders in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "log"

 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
)

// AccountWrapper encapsulates AWS Identity and Access Management (IAM) account
 actions
```

```
// used in the examples.
// It contains an IAM service client that is used to perform account actions.
type AccountWrapper struct {
 IamClient *iam.Client
}

// ListSAMLProviders gets the SAML providers for the account.
func (wrapper AccountWrapper) ListSAMLProviders(ctx context.Context)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

List the SAML providers.

```
import { ListSAMLProvidersCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});
```

```
export const listSamlProviders = async () => {
  const command = new ListSAMLProvidersCommand({});

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see ListSAMLProviders in *AWS SDK for JavaScript API Reference*.

PHP

SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
$uuid = uniqid();
$service = new IAMService();

    public function listSAMLProviders()
    {
        return $this->iamClient->listSAMLProviders();
    }
```

- For API details, see ListSAMLProviders in *AWS SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the list of SAML 2.0 providers created in the current AWS account. It returns the ARN, creation date, and expiration date for each SAML provider.

```
Get-IAMSAMLProviderList
```

Output:

```
Arn                                                  CreateDate
   ValidUntil
---                                                  ----------
   ----------
arn:aws:iam::123456789012:saml-provider/SAMLADFS     12/23/2014 12:16:55 PM
   12/23/2114 12:16:54 PM
```

- For API details, see ListSAMLProviders in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the list of SAML 2.0 providers created in the current AWS account. It returns the ARN, creation date, and expiration date for each SAML provider.

```
Get-IAMSAMLProviderList
```

Output:

```
Arn                                                  CreateDate
   ValidUntil
---                                                  ----------
   ----------

Use `ListServerCertificates` with an AWS SDK or CLI

The following code examples show how to use `ListServerCertificates`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::listServerCertificates(
        const Aws::Client::ClientConfiguration &clientConfig) {
    const Aws::String DATE_FORMAT = "%Y-%m-%d";

    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::ListServerCertificatesRequest request;

    bool done = false;
    bool header = false;
    while (!done) {
        auto outcome = iam.ListServerCertificates(request);
        if (!outcome.IsSuccess()) {
            std::cerr << "Failed to list server certificates: " <<
                      outcome.GetError().GetMessage() << std::endl;
            return false;
        }

        if (!header) {
            std::cout << std::left << std::setw(55) << "Name" <<
                      std::setw(30) << "ID" << std::setw(80) << "Arn" <<
                      std::setw(14) << "UploadDate" << std::setw(14) <<
                      "ExpirationDate" << std::endl;
            header = true;
        }
```

```
        const auto &certificates =
                outcome.GetResult().GetServerCertificateMetadataList();

        for (const auto &certificate: certificates) {
            std::cout << std::left << std::setw(55) <<
                      certificate.GetServerCertificateName() << std::setw(30) <<
                      certificate.GetServerCertificateId() << std::setw(80) <<
                      certificate.GetArn() << std::setw(14) <<

 certificate.GetUploadDate().ToGmtString(DATE_FORMAT.c_str()) <<
                      std::setw(14) <<

 certificate.GetExpiration().ToGmtString(DATE_FORMAT.c_str()) <<
                      std::endl;
        }

        if (outcome.GetResult().GetIsTruncated()) {
            request.SetMarker(outcome.GetResult().GetMarker());
        }
        else {
            done = true;
        }
    }

    return true;
}
```

- For API details, see ListServerCertificates in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To list the server certificates in your AWS account

The following `list-server-certificates` command lists all of the server certificates stored and available for use in your AWS account.

```
aws iam list-server-certificates
```

Output:

```
{
    "ServerCertificateMetadataList": [
        {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListUserPolicies` with an AWS SDK or CLI

The following code examples show how to use `ListUserPolicies`.

CLI

AWS CLI

To list policies for an IAM user

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
```

```
    --user-name Bob
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see ListUserPolicies in *AWS CLI Command Reference*.

Go

SDK for Go V2

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import (
 "context"
 "encoding/json"
 "errors"
 "log"

 "github.com/aws/aws-sdk-go-v2/aws"
 "github.com/aws/aws-sdk-go-v2/service/iam"
 "github.com/aws/aws-sdk-go-v2/service/iam/types"
 "github.com/aws/smithy-go"
)

// UserWrapper encapsulates user actions used in the examples.
// It contains an IAM service client that is used to perform user actions.
```

```
type UserWrapper struct {
 IamClient *iam.Client
}

// ListUserPolicies lists the inline policies for the specified user.
func (wrapper UserWrapper) ListUserPolicies(ctx context.Context, userName string)
 ([]string, error) {
 var policies []string
 result, err := wrapper.IamClient.ListUserPolicies(ctx,
 &iam.ListUserPoliciesInput{
  UserName: aws.String(userName),
 })
 if err != nil {
  log.Printf("Couldn't list policies for user %v. Here's why: %v\n", userName,
 err)
 } else {
  policies = result.PolicyNames
 }
 return policies, err
}
```

- For API details, see ListUserPolicies in *AWS SDK for Go API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the list of names of the inline policies that are embedded in the IAM user named `David`.

```
Get-IAMUserPolicyList -UserName David
```

Output:

```
Davids_IAM_Admin_Policy
```

- For API details, see ListUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the list of names of the inline policies that are embedded in the IAM user named `David`.

```
Get-IAMUserPolicyList -UserName David
```

Output:

```
Davids_IAM_Admin_Policy
```

- For API details, see ListUserPolicies in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListUserTags` with a CLI

The following code examples show how to use `ListUserTags`.

CLI

AWS CLI

To list the tags attached to a user

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
    --user-name alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
```

```
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListUserTags in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example fetches the tag associated with the user.

```
Get-IAMUserTagList -UserName joe
```

- For API details, see ListUserTags in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example fetches the tag associated with the user.

```
Get-IAMUserTagList -UserName joe
```

- For API details, see ListUserTags in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListUsers` with an AWS SDK or CLI

The following code examples show how to use `ListUsers`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

.NET

Use `ListVirtualMfaDevices` with a CLI

The following code examples show how to use `ListVirtualMfaDevices`.

CLI

AWS CLI

To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see ListVirtualMfaDevices in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves a collection of the virtual MFA devices that are assigned to users in the AWS account. The `User` property of each is an object with details of the IAM user to which the device is assigned.

```
Get-IAMVirtualMFADevice -AssignmentStatus Assigned
```

Output:

```
Base32StringSeed :
EnableDate       : 4/13/2015 12:03:42 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/David
User             : Amazon.IdentityManagement.Model.User

Base32StringSeed :
EnableDate       : 4/13/2015 12:06:41 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/root-account-mfa-device
User             : Amazon.IdentityManagement.Model.User
```

- For API details, see ListVirtualMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves a collection of the virtual MFA devices that are assigned to users in the AWS account. The `User` property of each is an object with details of the IAM user to which the device is assigned.

```
Get-IAMVirtualMFADevice -AssignmentStatus Assigned
```

Output:

```
Base32StringSeed :
EnableDate       : 4/13/2015 12:03:42 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/David
User             : Amazon.IdentityManagement.Model.User

Base32StringSeed :
EnableDate       : 4/13/2015 12:06:41 PM
QRCodePNG        :
SerialNumber     : arn:aws:iam::123456789012:mfa/root-account-mfa-device
User             : Amazon.IdentityManagement.Model.User
```

- For API details, see ListVirtualMfaDevices in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutGroupPolicy` with a CLI

The following code examples show how to use `PutGroupPolicy`.

CLI

AWS CLI

To add a policy to a group

The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy \
    --group-name Admins \
    --policy-document file://AdminPolicy.json \
    --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see PutGroupPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an inline policy named `AppTesterPolicy` and embeds it in the IAM group `AppTesters`. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes the file `apptesterpolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMGroupPolicy -GroupName AppTesters -PolicyName AppTesterPolicy -
PolicyDocument (Get-Content -Raw apptesterpolicy.json)
```

- For API details, see PutGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an inline policy named `AppTesterPolicy` and embeds it in the IAM group `AppTesters`. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes the file `apptesterpolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMGroupPolicy -GroupName AppTesters -PolicyName AppTesterPolicy -
PolicyDocument (Get-Content -Raw apptesterpolicy.json)
```

- For API details, see PutGroupPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutRolePermissionsBoundary` with a CLI

The following code examples show how to use `PutRolePermissionsBoundary`.

CLI

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM role

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --role-name x-account-admin
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to set the Permission boundary for a IAM Role. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMRolePermissionsBoundary -RoleName MyRoleName -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to set the Permission boundary for a IAM Role. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMRolePermissionsBoundary -RoleName MyRoleName -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutRolePermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutRolePolicy` with an AWS SDK or CLI

The following code examples show how to use `PutRolePolicy`.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Update the inline policy document embedded in a role.
    /// </summary>
    /// <param name="policyName">The name of the policy to embed.</param>
    /// <param name="roleName">The name of the role to update.</param>
    /// <param name="policyDocument">The policy document that defines the role.</
param>
    /// <returns>A Boolean value indicating the success of the action.</returns>
```

```
    public async Task<bool> PutRolePolicyAsync(string policyName, string
 roleName, string policyDocument)
    {
        var request = new PutRolePolicyRequest
        {
            PolicyName = policyName,
            RoleName = roleName,
            PolicyDocument = policyDocument
        };

        var response = await _IAMService.PutRolePolicyAsync(request);
        return response.HttpStatusCode == HttpStatusCode.OK;
    }
```

- For API details, see PutRolePolicy in *AWS SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::putRolePolicy(
        const Aws::String &roleName,
        const Aws::String &policyName,
        const Aws::String &policyDocument,
        const Aws::Client::ClientConfiguration &clientConfig) {
    Aws::IAM::IAMClient iamClient(clientConfig);
    Aws::IAM::Model::PutRolePolicyRequest request;

    request.SetRoleName(roleName);
    request.SetPolicyName(policyName);
    request.SetPolicyDocument(policyDocument);

    Aws::IAM::Model::PutRolePolicyOutcome outcome =
 iamClient.PutRolePolicy(request);
```

```
    if (!outcome.IsSuccess()) {
        std::cerr << "Error putting policy on role. " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
    else {
        std::cout << "Successfully put the role policy." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see PutRolePolicy in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePolicy in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { PutRolePolicyCommand, IAMClient } from "@aws-sdk/client-iam";

const examplePolicyDocument = JSON.stringify({
  Version: "2012-10-17",
  Statement: [
    {
      Sid: "VisualEditor0",
      Effect: "Allow",

 */
export const putRolePolicy = async (roleName, policyName, policyDocument) => {
  const command = new PutRolePolicyCommand({
    RoleName: roleName,
    PolicyName: policyName,
    PolicyDocument: policyDocument,
  });

  const response = await client.send(command);
  console.log(response);
  return response;
};
```

- For API details, see PutRolePolicy in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates an inline policy named `FedTesterRolePolicy` and embeds it in the IAM role `FedTesterRole`. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file `FedTesterPolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMRolePolicy -RoleName FedTesterRole -PolicyName FedTesterRolePolicy -
PolicyDocument (Get-Content -Raw FedTesterPolicy.json)
```

- For API details, see PutRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an inline policy named `FedTesterRolePolicy` and embeds it in the IAM role `FedTesterRole`. If an inline policy with the same name

already exists, then it is overwritten. The JSON policy content comes from the file `FedTesterPolicy.json`. Note that you must use the `-Raw` parameter to successfully process the content of the JSON file.

```
Write-IAMRolePolicy -RoleName FedTesterRole -PolicyName FedTesterRolePolicy -
PolicyDocument (Get-Content -Raw FedTesterPolicy.json)
```

- For API details, see PutRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `PutUserPermissionsBoundary` with a CLI

The following code examples show how to use `PutUserPermissionsBoundary`.

CLI

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM user

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --user-name intern
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed pollicy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --user-name developer
```

This command produces no output.

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPermissionsBoundary in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows how to set the Permission boundary for the user. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMUserPermissionsBoundary -UserName joe -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example shows how to set the Permission boundary for the user. You can set AWS Managed policies or Custom policies as permission boundary.

```
Set-IAMUserPermissionsBoundary -UserName joe -PermissionsBoundary
 arn:aws:iam::123456789012:policy/intern-boundary
```

- For API details, see PutUserPermissionsBoundary in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutUserPolicy` with an AWS SDK or CLI

The following code examples show how to use `PutUserPolicy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPolicy in *AWS CLI Command Reference*.

 (Get-Content -Raw EC2AccessPolicy.json)
```

- For API details, see PutUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates an inline policy named EC2AccessPolicy and embeds it in the IAM user Bob. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file EC2AccessPolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.

```
Write-IAMUserPolicy -UserName Bob -PolicyName EC2AccessPolicy -PolicyDocument
 (Get-Content -Raw EC2AccessPolicy.json)
```

- For API details, see PutUserPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
# Creates an inline policy for a specified user.
# @param username [String] The name of the IAM user.
# @param policy_name [String] The name of the policy to create.
# @param policy_document [String] The JSON policy document.
# @return [Boolean]
def create_user_policy(username, policy_name, policy_document)
  @iam_client.put_user_policy({
                                user_name: username,
                                policy_name: policy_name,
                                policy_document: policy_document
                              })
  @logger.info("Policy #{policy_name} created for user #{username}.")
  true
rescue Aws::IAM::Errors::ServiceError => e
  @logger.error("Couldn't create policy #{policy_name} for user #{username}.
Here's why:")
  @logger.error("\t#{e.code}: #{e.message}")
  false
end
```

- For API details, see PutUserPolicy in *AWS SDK for Ruby API Reference*.

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import AWSIAM
import AWSS3

    func putUserPolicy(policyDocument: String, policyName: String, user:
 IAMClientTypes.User) async throws {
        let input = PutUserPolicyInput(
            policyDocument: policyDocument,
            policyName: policyName,
            userName: user.userName
        )
        do {
            _ = try await iamClient.putUserPolicy(input: input)
        } catch {
            print("ERROR: putUserPolicy:", dump(error))
            throw error
        }
    }
```

- For API details, see PutUserPolicy in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveClientIdFromOpenIdConnectProvider` with a CLI

The following code examples show how to use `RemoveClientIdFromOpenIdConnectProvider`.

CLI

AWS CLI

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
    --client-id My-TestApp-3 \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
Remove-IAMClientIDFromOpenIDConnectProvider -ClientID My-TestApp-3
 -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
Remove-IAMClientIDFromOpenIDConnectProvider -ClientID My-TestApp-3
 -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveRoleFromInstanceProfile` with a CLI

The following code examples show how to use `RemoveRoleFromInstanceProfile`.

CLI

AWS CLI

To remove a role from an instance profile

The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see RemoveRoleFromInstanceProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the role named `MyNewRole` from the EC2 instance profile named `MyNewRole`. An instance profile that is created in the IAM console always has the same name as the role, as in this example. If you create them in the API or CLI, then they can have different names.

```
Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyNewRole -RoleName
 MyNewRole -Force
```

- For API details, see RemoveRoleFromInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the role named `MyNewRole` from the EC2 instance profile named `MyNewRole`. An instance profile that is created in the IAM console always has the same name as the role, as in this example. If you create them in the API or CLI, then they can have different names.

```
Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyNewRole -RoleName
 MyNewRole -Force
```

- For API details, see RemoveRoleFromInstanceProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RemoveUserFromGroup` with a CLI

The following code examples show how to use `RemoveUserFromGroup`.

CLI

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` command removes the user named Bob from the IAM group named `Admins`.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see RemoveUserFromGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the IAM user Bob from the group `Testers`.

```
Remove-IAMUserFromGroup -GroupName Testers -UserName Bob
```

Example 2: This example finds any groups of which IAM user `Theresa` is a member, and then removes `Theresa` from those groups.

```
$groups = Get-IAMGroupForUser -UserName Theresa
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName
 -UserName Theresa -Force }
```

Example 3: This example shows an alternate way of removing the IAM user Bob from the `Testers` group.

```
Get-IAMGroupForUser -UserName Bob | Remove-IAMUserFromGroup -UserName Bob -
GroupName Testers -Force
```

- For API details, see RemoveUserFromGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the IAM user Bob from the group `Testers`.

```
Remove-IAMUserFromGroup -GroupName Testers -UserName Bob
```

Example 2: This example finds any groups of which IAM user Theresa is a member, and then removes Theresa from those groups.

```
$groups = Get-IAMGroupForUser -UserName Theresa
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName
 -UserName Theresa -Force }
```

Example 3: This example shows an alternate way of removing the IAM user Bob from the Testers group.

```
Get-IAMGroupForUser -UserName Bob | Remove-IAMUserFromGroup -UserName Bob -
GroupName Testers -Force
```

- For API details, see RemoveUserFromGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use ResyncMfaDevice with a CLI

The following code examples show how to use ResyncMfaDevice.

CLI

AWS CLI

To synchronize an MFA device

The following resync-mfa-device example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is arn:aws:iam::123456789012:mfa/BobsMFADevice with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
```

```
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ResyncMfaDevice in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/bob` with an authenticator program that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/theresa -
AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Bob
```

Example 2: This example synchronizes the IAM MFA device that is associated with the IAM user `Theresa` with a physical device that has the serial number `ABCD12345678` and that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber ABCD12345678 -AuthenticationCode1 123456 -
AuthenticationCode2 987654 -UserName Theresa
```

- For API details, see ResyncMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/bob` with an authenticator program that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/theresa -
AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Bob
```

Example 2: This example synchronizes the IAM MFA device that is associated with the IAM user Theresa with a physical device that has the serial number ABCD12345678 and that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber ABCD12345678 -AuthenticationCode1 123456 -
AuthenticationCode2 987654 -UserName Theresa
```

- For API details, see ResyncMfaDevice in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `SetDefaultPolicyVersion` with a CLI

The following code examples show how to use `SetDefaultPolicyVersion`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Manage policies
- Roll back a policy version

CLI

AWS CLI

To set the specified version of the specified policy as the policy's default version.

This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
Set-IAMDefaultPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy
 -VersionId v2
```

- For API details, see SetDefaultPolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
Set-IAMDefaultPolicyVersion -PolicyArn arn:aws:iam::123456789012:policy/MyPolicy
 -VersionId v2
```

- For API details, see SetDefaultPolicyVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `TagRole` with a CLI

The following code examples show how to use `TagRole`.

CLI

AWS CLI

To add a tag to a role

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role \
```

```
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds tag to Role in Identity Management Service

```
Add-IAMRoleTag -RoleName AdminRoleacess -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds tag to Role in Identity Management Service

```
Add-IAMRoleTag -RoleName AdminRoleacess -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `TagUser` with a CLI

The following code examples show how to use `TagUser`.

CLI

AWS CLI

To add a tag to a user

The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
    --user-name alice \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds tag to User in Identity Management Service

```
Add-IAMUserTag -UserName joe -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds tag to User in Identity Management Service

```
Add-IAMUserTag -UserName joe -Tag @{ Key = 'abac'; Value = 'testing'}
```

- For API details, see TagUser in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UntagRole` with a CLI

The following code examples show how to use `UntagRole`.

CLI

AWS CLI

To remove a tag from a role

The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the tag from the role named "MyRoleName" with tag key as "abac". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMRoleTag -RoleName MyRoleName -TagKey "abac","xyzw"
```

- For API details, see UntagRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the tag from the role named "MyRoleName" with tag key as "abac". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMRoleTag -RoleName MyRoleName -TagKey "abac","xyzw"
```

- For API details, see UntagRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UntagUser` with a CLI

The following code examples show how to use `UntagUser`.

CLI

AWS CLI

To remove a tag from a user

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagUser in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes the tag from the user named "joe" with tag key as "abac" and "xyzw". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMUserTag -UserName joe -TagKey "abac","xyzw"
```

- For API details, see UntagUser in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes the tag from the user named "joe" with tag key as "abac" and "xyzw". To remove multiple tags, provide a comma separted tag keys list.

```
Remove-IAMUserTag -UserName joe -TagKey "abac","xyzw"
```

- For API details, see UntagUser in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAccessKey` with an AWS SDK or CLI

The following code examples show how to use `UpdateAccessKey`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access keys

Bash

AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function iam_update_access_key
#
# This function can activate or deactivate an IAM access key for the specified
 IAM user.
#
# Parameters:
#       -u user_name  -- The name of the user.
#       -k access_key -- The access key to update.
#       -a            -- Activate the selected access key.
#       -d            -- Deactivate the selected access key.
#
# Example:
#       # To deactivate the selected access key for IAM user Bob
#       iam_update_access_key -u Bob -k AKIAIOSFODNN7EXAMPLE -d
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
##############################################################################
function iam_update_access_key() {

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateAccessKey(const Aws::String &userName,
                                  const Aws::String &accessKeyID,
                                  Aws::IAM::Model::StatusType status,
                                  const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::UpdateAccessKeyRequest request;
    request.SetUserName(userName);
    request.SetAccessKeyId(accessKeyID);
    request.SetStatus(status);

    auto outcome = iam.UpdateAccessKey(request);
    if (outcome.IsSuccess()) {
        std::cout << "Successfully updated status of access key "
                  << accessKeyID << " for user " << userName << std::endl;
    }
    else {
        std::cerr << "Error updated status of access key " << accessKeyID <<
                  " for user " << userName << ": " <<
                  outcome.GetError().GetMessage() << std::endl;
    }
```

```
    return outcome.IsSuccess();
}
```

- For API details, see UpdateAccessKey in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \
    --access-key-id AKIAIOSFODNN7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

                    .accessKeyId(accessId)
                    .userName(username)
                    .status(statusType)
                    .build();

            iam.updateAccessKey(request);
            System.out.printf("Successfully updated the status of access key %s
 to" +
                    "status %s for user %s", accessId, status, username);

        } catch (IamException e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
}
```

- For API details, see UpdateAccessKey in *AWS SDK for Java 2.x API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Update the access key.

```
import {
  UpdateAccessKeyCommand,
  IAMClient,
  StatusType,
} from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} userName
 * @param {string} accessKeyId
 */
export const updateAccessKey = (userName, accessKeyId) => {
  const command = new UpdateAccessKeyCommand({
    AccessKeyId: accessKeyId,
    Status: StatusType.Inactive,
    UserName: userName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateAccessKey in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  AccessKeyId: "ACCESS_KEY_ID",
  Status: "Active",
  UserName: "USER_NAME",
};

iam.updateAccessKey(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateAccessKey in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example changes the status of the access key `AKIAIOSFODNN7EXAMPLE` for the IAM user named Bob to `Inactive`.

```
Update-IAMAccessKey -UserName Bob -AccessKeyId AKIAIOSFODNN7EXAMPLE -Status
 Inactive
```

- For API details, see UpdateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example changes the status of the access key `AKIAIOSFODNN7EXAMPLE` for the IAM user named `Bob` to `Inactive`.

```
Update-IAMAccessKey -UserName Bob -AccessKeyId AKIAIOSFODNN7EXAMPLE -Status
 Inactive
```

- For API details, see UpdateAccessKey in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
def update_key(user_name, key_id, activate):
    """
    Updates the status of a key.

    :param user_name: The user that owns the key.
    :param key_id: The ID of the key to update.
    :param activate: When True, the key is activated. Otherwise, the key is
 deactivated.
    """

    try:
        key = iam.User(user_name).AccessKey(key_id)
        if activate:
            key.activate()
        else:
```

```
            key.deactivate()
        logger.info("%s key %s.", "Activated" if activate else "Deactivated",
key_id)
    except ClientError:
        logger.exception(
            "Couldn't %s key %s.", "Activate" if activate else "Deactivate",
key_id
        )
        raise
```

- For API details, see UpdateAccessKey in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAccountPasswordPolicy` with a CLI

The following code examples show how to use `UpdateAccountPasswordPolicy`.

CLI

AWS CLI

To set or change the current account password policy

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
    --minimum-password-length 8 \
    --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccountPasswordPolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the password policy for the account with the specified settings. Note that any parameters that are not included in the command are not left unmodified. Instead, they are reset to default values.

```
Update-IAMAccountPasswordPolicy -AllowUsersToChangePasswords $true -HardExpiry
 $false -MaxPasswordAge 90 -MinimumPasswordLength 8 -PasswordReusePrevention 20
 -RequireLowercaseCharacters $true -RequireNumbers $true -RequireSymbols $true -
RequireUppercaseCharacters $true
```

- For API details, see UpdateAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the password policy for the account with the specified settings. Note that any parameters that are not included in the command are not left unmodified. Instead, they are reset to default values.

```
Update-IAMAccountPasswordPolicy -AllowUsersToChangePasswords $true -HardExpiry
 $false -MaxPasswordAge 90 -MinimumPasswordLength 8 -PasswordReusePrevention 20
 -RequireLowercaseCharacters $true -RequireNumbers $true -RequireSymbols $true -
RequireUppercaseCharacters $true
```

- For API details, see UpdateAccountPasswordPolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssumeRolePolicy` with a CLI

The following code examples show how to use `UpdateAssumeRolePolicy`.

CLI

AWS CLI

To update the trust policy for an IAM role

The following `update-assume-role-policy` command updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see UpdateAssumeRolePolicy in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the IAM role named `ClientRole` with a new trust policy, the contents of which come from the file `ClientRolePolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMAssumeRolePolicy -RoleName ClientRole -PolicyDocument (Get-Content -raw
 ClientRolePolicy.json)
```

- For API details, see UpdateAssumeRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the IAM role named `ClientRole` with a new trust policy, the contents of which come from the file `ClientRolePolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMAssumeRolePolicy -RoleName ClientRole -PolicyDocument (Get-Content -raw
 ClientRolePolicy.json)
```

- For API details, see UpdateAssumeRolePolicy in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateGroup` with a CLI

The following code examples show how to use `UpdateGroup`.

CLI

AWS CLI

To rename an IAM group

The following `update-group` command changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example renames the IAM group `Testers` to `AppTesters`.

```
Update-IAMGroup -GroupName Testers -NewGroupName AppTesters
```

Example 2: This example changes the path of the IAM group `AppTesters` to `/Org1/Org2/`. This changes the ARN for the group to `arn:aws:iam::123456789012:group/Org1/Org2/AppTesters`.

```
Update-IAMGroup -GroupName AppTesters -NewPath /Org1/Org2/
```

- For API details, see UpdateGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example renames the IAM group `Testers` to `AppTesters`.

```
Update-IAMGroup -GroupName Testers -NewGroupName AppTesters
```

Example 2: This example changes the path of the IAM group `AppTesters` to `/Org1/Org2/`. This changes the ARN for the group to `arn:aws:iam::123456789012:group/Org1/Org2/AppTesters`.

```
Update-IAMGroup -GroupName AppTesters -NewPath /Org1/Org2/
```

- For API details, see UpdateGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateLoginProfile` with a CLI

The following code examples show how to use `UpdateLoginProfile`.

CLI

AWS CLI

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
    --user-name Bob \
    --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateLoginProfile in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example sets a new temporary password for the IAM user Bob, and requires the user to change the password the next time the user signs in.

```
Update-IAMLoginProfile -UserName Bob -Password "P@ssw0rd1234" -
PasswordResetRequired $true
```

- For API details, see UpdateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example sets a new temporary password for the IAM user Bob, and requires the user to change the password the next time the user signs in.

```
Update-IAMLoginProfile -UserName Bob -Password "P@ssw0rd1234" -
PasswordResetRequired $true
```

- For API details, see UpdateLoginProfile in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateOpenIdConnectProviderThumbprint` with a CLI

The following code examples show how to use `UpdateOpenIdConnectProviderThumbprint`.

CLI

AWS CLI

To replace the existing list of server certificate thumbprints with a new list

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com \
    --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint. The OIDC provider shares the new value when the certificate that is associated with the provider changes.

```
Update-IAMOpenIDConnectProviderThumbprint -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com -ThumbprintList
 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint. The OIDC provider shares the new value when the certificate that is associated with the provider changes.

```
Update-IAMOpenIDConnectProviderThumbprint -OpenIDConnectProviderArn
 arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com -ThumbprintList
 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateRole` with a CLI

The following code examples show how to use `UpdateRole`.

CLI

AWS CLI

To change an IAM role's description or session duration

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the role description and the maximum session duration value(in seconds) for which a role's session can be requested.

```
Update-IAMRole -RoleName MyRoleName -Description "My testing role" -
MaxSessionDuration 43200
```

- For API details, see UpdateRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the role description and the maximum session duration value(in seconds) for which a role's session can be requested.

```
Update-IAMRole -RoleName MyRoleName -Description "My testing role" -
MaxSessionDuration 43200
```

- For API details, see UpdateRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateRoleDescription` with a CLI

The following code examples show how to use `UpdateRoleDescription`.

CLI

AWS CLI

To change an IAM role's description

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
    --role-name production-role \
    --description 'Main production role'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "production-role",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/production-role",
        "CreateDate": "2017-12-06T17:16:37+00:00",
        "AssumeRolePolicyDocument": {
            "Version":"2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole",
                    "Condition": {}
                }
            ]
        },
```

```
        "Description": "Main production role"
    }
}
```

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRoleDescription in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the description of an IAM role in your account.

```
Update-IAMRoleDescription -RoleName MyRoleName -Description "My testing role"
```

- For API details, see UpdateRoleDescription in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the description of an IAM role in your account.

```
Update-IAMRoleDescription -RoleName MyRoleName -Description "My testing role"
```

- For API details, see UpdateRoleDescription in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateSamlProvider` with a CLI

The following code examples show how to use `UpdateSamlProvider`.

CLI

AWS CLI

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateSamlProvider in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)
```

- For API details, see UpdateSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`. Note that you must use the `-Raw` switch parameter to successfully process the contents of the JSON file.

```
Update-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/
SAMLADFS -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)
```

- For API details, see UpdateSamlProvider in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `UpdateServerCertificate`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateServerCertificate(const Aws::String
 &currentCertificateName,
                                           const Aws::String &newCertificateName,
                                           const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);
    Aws::IAM::Model::UpdateServerCertificateRequest request;
    request.SetServerCertificateName(currentCertificateName);
    request.SetNewServerCertificateName(newCertificateName);

    auto outcome = iam.UpdateServerCertificate(request);
    bool result = true;
    if (outcome.IsSuccess()) {
        std::cout << "Server certificate " << currentCertificateName
                  << " successfully renamed as " << newCertificateName
                  << std::endl;
```

```
    }
    else {
        if (outcome.GetError().GetErrorType() !=
 Aws::IAM::IAMErrors::NO_SUCH_ENTITY) {
            std::cerr << "Error changing name of server certificate " <<
                      currentCertificateName << " to " << newCertificateName <<
 ":" <<
                      outcome.GetError().GetMessage() << std::endl;
            result = false;
        }
        else {
            std::cout << "Certificate '" << currentCertificateName
                      << "' not found." << std::endl;
        }
    }

    return result;
}
```

- For API details, see UpdateServerCertificate in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
    --server-certificate-name myServerCertificate \
    --new-server-certificate-name myUpdatedServerCertificate \
    --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UpdateServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Update a server certificate.

```
import { UpdateServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";

const client = new IAMClient({});

/**
 *
 * @param {string} currentName
 * @param {string} newName
 */
export const updateServerCertificate = (currentName, newName) => {
  const command = new UpdateServerCertificateCommand({
    ServerCertificateName: currentName,
    NewServerCertificateName: newName,
  });

  return client.send(command);
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see UpdateServerCertificate in *AWS SDK for JavaScript API Reference*.

SDK for JavaScript (v2)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
var AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

// Create the IAM service object
var iam = new AWS.IAM({ apiVersion: "2010-05-08" });

var params = {
  ServerCertificateName: "CERTIFICATE_NAME",
  NewServerCertificateName: "NEW_CERTIFICATE_NAME",
};

iam.updateServerCertificate(params, function (err, data) {
  if (err) {
    console.log("Error", err);
  } else {
    console.log("Success", data);
  }
});
```

- For API details, see UpdateServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example renames the certificate named `MyServerCertificate` to `MyRenamedServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -
NewServerCertificateName MyRenamedServerCertificate
```

Example 2: This example moves the certificate named `MyServerCertificate` to the path `/Org1/Org2/`. This changes the ARN for the resource to `arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -NewPath /
Org1/Org2/
```

- For API details, see UpdateServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example renames the certificate named `MyServerCertificate` to `MyRenamedServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -
NewServerCertificateName MyRenamedServerCertificate
```

Example 2: This example moves the certificate named `MyServerCertificate` to the path `/Org1/Org2/`. This changes the ARN for the resource to `arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyServerCertificate`.

```
Update-IAMServerCertificate -ServerCertificateName MyServerCertificate -NewPath /
Org1/Org2/
```

- For API details, see UpdateServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `UpdateSigningCertificate` with a CLI

The following code examples show how to use `UpdateSigningCertificate`.

CLI

AWS CLI

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see UpdateSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the certificate that is associated with the IAM user named Bob and whose certificate ID si Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU to mark it as inactive.

```
Update-IAMSigningCertificate -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU -
UserName Bob -Status Inactive
```

- For API details, see UpdateSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the certificate that is associated with the IAM user named Bob and whose certificate ID si Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU to mark it as inactive.

```
Update-IAMSigningCertificate -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU -
UserName Bob -Status Inactive
```

- For API details, see UpdateSigningCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateUser` with an AWS SDK or CLI

The following code examples show how to use `UpdateUser`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create read-only and read-write users

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::IAM::updateUser(const Aws::String &currentUserName,
                             const Aws::String &newUserName,
                             const Aws::Client::ClientConfiguration
 &clientConfig) {
    Aws::IAM::IAMClient iam(clientConfig);

    Aws::IAM::Model::UpdateUserRequest request;
    request.SetUserName(currentUserName);
    request.SetNewUserName(newUserName);
```

```
    auto outcome = iam.UpdateUser(request);
    if (outcome.IsSuccess()) {
        std::cout << "IAM user " << currentUserName <<
                  " successfully updated with new user name " << newUserName <<
                  std::endl;
    }
    else {
        std::cerr << "Error updating user name for IAM user " << currentUserName
 <<
                  ":" << outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see UpdateUser in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To change an IAM user's name

The following `update-user` command changes the name of the IAM user Bob to `Robert`.

```
aws iam update-user \
    --user-name Bob \
    --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UploadServerCertificate` with an AWS SDK or CLI

The following code examples show how to use `UploadServerCertificate`.

CLI

AWS CLI

To upload a server certificate to your AWS account

The following **upload-server-certificate** command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name *myServerCertificate*. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
    --server-certificate-name myServerCertificate \
    --certificate-body file://public_key_cert_file.pem \
```

```
    --private-key file://my_private_key.pem \
    --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "Arn": "arn:aws:iam::1234567989012:server-certificate/
myServerCertificate",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.

- For API details, see UploadServerCertificate in *AWS CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { UploadServerCertificateCommand, IAMClient } from "@aws-sdk/client-iam";
import { readFileSync } from "node:fs";
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";
import * as path from "node:path";

const client = new IAMClient({});

const certMessage = `Generate a certificate and key with the following command,
 or the equivalent for your system.
```

```
openssl req -x509 -newkey rsa:4096 -sha256 -days 3650 -nodes \

-addext "subjectAltName=DNS:example.com,DNS:www.example.net,IP:10.0.0.1"
`;

const getCertAndKey = () => {
  try {
    const cert = readFileSync(
      path.join(dirnameFromMetaUrl(import.meta.url), "./example.crt"),
    );
    const key = readFileSync(
      path.join(dirnameFromMetaUrl(import.meta.url), "./example.key"),
    );
    return { cert, key };
  } catch (err) {
    if (err.code === "ENOENT") {
      throw new Error(
        `Certificate and/or private key not found. ${certMessage}`,
      );
    }

    throw err;
  }
};

/**
 *
 * @param {string} certificateName
 */
export const uploadServerCertificate = (certificateName) => {
  const { cert, key } = getCertAndKey();
  const command = new UploadServerCertificateCommand({
    ServerCertificateName: certificateName,
    CertificateBody: cert.toString(),
    PrivateKey: key.toString(),
  });

  return client.send(command);
};
```

- For API details, see UploadServerCertificate in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example uploads a new server certificate to the IAM account. The files containing the certificate body, the private key, and (optionally) the certificate chain must all be PEM encoded. Note that the parameters require the actual content of the files rather than the file names. You must use the `-Raw` switch parameter to successfully process the file contents.

```
Publish-IAMServerCertificate -ServerCertificateName MyTestCert -CertificateBody
 (Get-Content -Raw server.crt) -PrivateKey (Get-Content -Raw server.key)
```

Output:

```
Arn                 : arn:aws:iam::123456789012:server-certificate/MyTestCert
Expiration          : 1/14/2018 9:52:36 AM
Path                : /
ServerCertificateId : ASCAJIEXAMPLE7J7HQZYW
ServerCertificateName : MyTestCert
UploadDate          : 4/21/2015 11:14:16 AM
```

- For API details, see UploadServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example uploads a new server certificate to the IAM account. The files containing the certificate body, the private key, and (optionally) the certificate chain must all be PEM encoded. Note that the parameters require the actual content of the files rather than the file names. You must use the `-Raw` switch parameter to successfully process the file contents.

```
Publish-IAMServerCertificate -ServerCertificateName MyTestCert -CertificateBody
 (Get-Content -Raw server.crt) -PrivateKey (Get-Content -Raw server.key)
```

Output:

```
Arn                 : arn:aws:iam::123456789012:server-certificate/MyTestCert
Expiration          : 1/14/2018 9:52:36 AM
```

```
Path                  : /
ServerCertificateId   : ASCAJIEXAMPLE7J7HQZYW
ServerCertificateName : MyTestCert
UploadDate            : 4/21/2015 11:14:16 AM
```

- For API details, see UploadServerCertificate in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UploadSigningCertificate` with a CLI

The following code examples show how to use `UploadSigningCertificate`.

CLI

AWS CLI

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END
 CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

- For API details, see UploadSigningCertificate in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example uploads a new X.509 signing certificate and associates it with the IAM user named Bob. The file containing the certificate body is PEM encoded. The `CertificateBody` parameter requires the actual contents of the certificate file rather than the file name. You must use the `-Raw` switch parameter to successfully process the file.

```
Publish-IAMSigningCertificate -UserName Bob -CertificateBody (Get-Content -Raw
 SampleSigningCert.pem)
```

Output:

```
CertificateBody : -----BEGIN CERTIFICATE-----

```

- For API details, see [UploadSigningCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example uploads a new X.509 signing certificate and associates it with the IAM user named Bob. The file containing the certificate body is PEM encoded. The `CertificateBody` parameter requires the actual contents of the certificate file rather than the file name. You must use the `-Raw` switch parameter to successfully process the file.

```
Publish-IAMSigningCertificate -UserName Bob -CertificateBody (Get-Content -Raw
 SampleSigningCert.pem)
```

Output:

```
CertificateBody : -----BEGIN CERTIFICATE-----

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for IAM using AWS SDKs

The following code examples show you how to implement common scenarios in IAM with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within IAM or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Build and manage a resilient service using an AWS SDK
- Create read-only and read-write IAM users using an AWS SDK
- Manage IAM access keys using an AWS SDK
- Manage IAM policies using an AWS SDK
- Manage IAM roles using an AWS SDK
- Manage your IAM account using an AWS SDK
- Allows the AWS Compute Optimizer Automation feature to apply recommended actions
- Policy to enable Automation across your organization
- Policy to enable Automation for your account
- Policy to grant full access to Compute Optimizer Automation for a management account of an organization
- Policy to grant full access to Compute Optimizer Automation for standalone AWS accounts
- Policy to grant read-only access to Compute Optimizer Automation for a management account of an organization
- Policy to grant read-only access to Compute Optimizer Automation for standalone AWS accounts
- Policy to grants service-linked role permissions for Compute Optimization Automation
- Roll back an IAM policy version using an AWS SDK
- Set up Attribute-Based Access Control for DynamoDB using AWS Command Line Interface v2
- Work with DynamoDB Streams and Time-to-Live using AWS Command Line Interface v2
- Work with the IAM Policy Builder API using an AWS SDK

Build and manage a resilient service using an AWS SDK

The following code examples show how to create a load-balanced web service that returns book, movie, and song recommendations. The example shows how the service responds to failures, and how to restructure the service for more resilience when failures occur.

- Use an Amazon EC2 Auto Scaling group to create Amazon Elastic Compute Cloud (Amazon EC2) instances based on a launch template and to keep the number of instances in a specified range.
- Handle and distribute HTTP requests with Elastic Load Balancing.
- Monitor the health of instances in an Auto Scaling group and forward requests only to healthy instances.

- Run a Python web server on each EC2 instance to handle HTTP requests. The web server responds with recommendations and health checks.
- Simulate a recommendation service with an Amazon DynamoDB table.
- Control web server response to requests and health checks by updating AWS Systems Manager parameters.

.NET

SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run the interactive scenario at a command prompt.

```
    static async Task Main(string[] args)
    {
        _configuration = new ConfigurationBuilder()
            .SetBasePath(Directory.GetCurrentDirectory())
            .AddJsonFile("settings.json") // Load settings from .json file.
            .AddJsonFile("settings.local.json",
                true) // Optionally, load local settings.
            .Build();

        // Set up dependency injection for the AWS services.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureLogging(logging =>
                logging.AddFilter("System", LogLevel.Debug)
                    .AddFilter<DebugLoggerProvider>("Microsoft",
LogLevel.Information)
                    .AddFilter<ConsoleLoggerProvider>("Microsoft",
LogLevel.Trace))
            .ConfigureServices((_, services) =>
                services.AddAWSService<IAmazonIdentityManagementService>()

                """
                        For this demo, we'll use the AWS SDK for Java (v2) to
create several AWS resources
                        to set up a load-balanced web service endpoint and
explore some ways to make it resilient
                        against various kinds of failures.

                        Some of the resources create by this demo are:
                        \t* A DynamoDB table that the web service depends on to
provide book, movie, and song recommendations.
                        \t* An EC2 launch template that defines EC2 instances
that each contain a Python web server.
                        \t* An EC2 Auto Scaling group that manages EC2 instances
across several Availability Zones.
                        \t* An Elastic Load Balancing (ELB) load balancer that
targets the Auto Scaling group to distribute requests.
                        """);

        System.out.println("""
                Let's implement a deep health check. For this demo, a deep health
check tests whether
                the web service can access the DynamoDB table that it depends on
for recommendations. Note that
                the deep health check is only for ELB routing and not for Auto
Scaling instance health.
                This kind of deep health check is not recommended for Auto
Scaling instance health, because it
                risks accidental termination of all instances in the Auto Scaling
group when a dependent service fails.
                """);

        System.out.println("""
                By implementing deep health checks, the load balancer can detect
when one of the instances is failing
                and take that instance out of rotation.
                """);

                """
                        Because the instances in this demo are controlled by an
auto scaler, the simplest way to fix an unhealthy
                        instance is to terminate it and let the auto scaler start
a new instance to replace it.
                        """);
        autoScaler.terminateInstance(badInstanceId);

        System.out.println("""
                Even while the instance is terminating and the new instance is
starting, sending a GET
                request to the web service continues to get a successful
recommendation response because
                the load balancer routes requests to the healthy instances. After
the replacement instance
                starts and reports as healthy, it is included in the load
balancing rotation.
                Note that terminating and replacing an instance typically takes
several minutes, during which time you
                can see the changing health check status until the new instance
is running and healthy.

Create read-only and read-write IAM users using an AWS SDK

The following code example shows how to create users and attach policies to them.

Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create two IAM users.
- Attach a policy for one user to get and put objects in an Amazon S3 bucket.
- Attach a policy for the second user to get objects from the bucket.
- Get different permissions to the bucket based on user credentials.

Python

SDK for Python (Boto3)

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that wrap IAM user actions.

Set up Attribute-Based Access Control for DynamoDB using AWS Command Line Interface v2

The following code example shows how to implement Attribute-Based Access Control (ABAC) for DynamoDB.

- Create an IAM policy for ABAC.
- Create tables with tags for different departments.
- List and filter tables based on tags.

Bash

AWS CLI with Bash script

Create an IAM policy for ABAC.

```
# Step 1: Create a policy document for ABAC
cat > abac-policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:PutItem",
        "dynamodb:UpdateItem",
        "dynamodb:DeleteItem",
        "dynamodb:BatchWriteItem"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}",
```

```
          "aws:ResourceTag/Environment": "Development"
        }
      }
    }
  ]
}
EOF

# Step 2: Create the IAM policy
aws iam create-policy \
    --policy-name DynamoDBDepartmentBasedAccess \
    --policy-document file://abac-policy.json
```

Create tables with tags for different departments.

```
# Create a DynamoDB table with tags for ABAC
aws dynamodb create-table \
    --table-name FinanceData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Finance \
        Key=Environment,Value=Development

# Create another table with different tags
aws dynamodb create-table \
    --table-name MarketingData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Marketing \
        Key=Environment,Value=Production
```

List and filter tables based on tags.

```
# List all DynamoDB tables
echo "Listing all tables:"
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nGetting ARNs for all tables:"
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text |
 xargs -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn"
 --output text)

# For each table ARN, list its tags
echo -e "\nListing tags for each table:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    echo -e "\nTags for table: $TABLE_NAME"
    aws dynamodb list-tags-of-resource --resource-arn $ARN
done

# Example: Find tables with a specific tag
echo -e "\nFinding tables with Environment=Production tag:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

Work with DynamoDB Streams and Time-to-Live using AWS Command Line Interface v2

The following code example shows how to manage DynamoDB Streams and Time-to-Live features.

- Create a table with Streams enabled.
- Describe Streams.
- Create a Lambda function for processing Streams.
- Enable TTL on a table.
- Add items with TTL attributes.
- Describe TTL settings.

Bash

AWS CLI with Bash script

Create a table with Streams enabled.

```
# Create a table with DynamoDB Streams enabled
aws dynamodb create-table \
    --table-name StreamsDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES
```

Describe Streams.

```
# Get information about the stream
aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.StreamSpecification"

# Get the stream ARN
STREAM_ARN=$(aws dynamodb describe-table \
    --table-name StreamsDemo \
```

```
    --query "Table.LatestStreamArn" \
    --output text)

echo "Stream ARN: $STREAM_ARN"

# Describe the stream
aws dynamodbstreams describe-stream \
    --stream-arn $STREAM_ARN
```

Create a Lambda function for Streams.

```
# Step 1: Create an IAM role for the Lambda function
cat > trust-policy.json << 'EOF'
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "lambda.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
EOF

aws iam create-role \
    --role-name DynamoDBStreamsLambdaRole \
    --assume-role-policy-document file://trust-policy.json

# Step 2: Attach permissions to the role
aws iam attach-role-policy \
    --role-name DynamoDBStreamsLambdaRole \
    --policy-arn arn:aws:iam::aws:policy/service-role/
AWSLambdaDynamoDBExecutionRole

# Step 3: Create a Lambda function (code would be in a separate file)
echo "Lambda function creation would be done separately with appropriate code"

# Step 4: Create an event source mapping
echo "Example command to create event source mapping:"
```

```
echo "aws lambda create-event-source-mapping \\"
echo "    --function-name ProcessDynamoDBRecords \\"
echo "    --event-source $STREAM_ARN \\"
echo "    --batch-size 100 \\"
echo "    --starting-position LATEST"
```

Enable TTL on a table.

```
# Create a table for TTL demonstration
aws dynamodb create-table \
    --table-name TTLDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST

# Wait for table to become active
aws dynamodb wait table-exists --table-name TTLDemo

# Enable TTL on the table
aws dynamodb update-time-to-live \
    --table-name TTLDemo \
    --time-to-live-specification "Enabled=true, AttributeName=ExpirationTime"
```

Add items with TTL attributes.

```
# Calculate expiration time (current time + 1 day in seconds)
EXPIRATION_TIME=$(date -d "+1 day" +%s)

# Add an item with TTL attribute
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item1"},
        "Data": {"S": "This item will expire in 1 day"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME'"}
    }'

# Add an item that expires in 1 hour
EXPIRATION_TIME_HOUR=$(date -d "+1 hour" +%s)
```

```
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item2"},
        "Data": {"S": "This item will expire in 1 hour"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME_HOUR'"}
    }'
```

Describe TTL settings.

```
# Describe TTL settings for a table
aws dynamodb describe-time-to-live \
    --table-name TTLDemo
```

Work with the IAM Policy Builder API using an AWS SDK

The following code example shows how to:

- Create IAM policies by using the object-oriented API.
- Use the IAM Policy Builder API with the IAM service.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The examples use the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.policybuilder.iam.IamConditionOperator;
import software.amazon.awssdk.policybuilder.iam.IamEffect;
import software.amazon.awssdk.policybuilder.iam.IamPolicy;
import software.amazon.awssdk.policybuilder.iam.IamPolicyWriter;
import software.amazon.awssdk.policybuilder.iam.IamPrincipal;
import software.amazon.awssdk.policybuilder.iam.IamPrincipalType;
import software.amazon.awssdk.policybuilder.iam.IamResource;
import software.amazon.awssdk.policybuilder.iam.IamStatement;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.iam.IamClient;
import software.amazon.awssdk.services.iam.model.GetPolicyResponse;
import software.amazon.awssdk.services.iam.model.GetPolicyVersionResponse;
import software.amazon.awssdk.services.sts.StsClient;

import java.net.URLDecoder;
import java.nio.charset.StandardCharsets;
import java.util.Arrays;
import java.util.List;
```

Create a time-based policy.

```
        public String timeBasedPolicyExample() {
                IamPolicy policy = IamPolicy.builder()
                                .addStatement(b -> b
                                                .effect(IamEffect.ALLOW)
                                                .addAction("dynamodb:GetItem")
```

```
                                                .addResource(IamResource.ALL)
                                                .addCondition(b1 -> b1

.operator(IamConditionOperator.DATE_GREATER_THAN)

.key("aws:CurrentTime")

.value("2020-04-01T00:00:00Z"))
                                                .addCondition(b1 -> b1

.operator(IamConditionOperator.DATE_LESS_THAN)

.key("aws:CurrentTime")

.value("2020-06-30T23:59:59Z")))
                                .build();

                // Use an IamPolicyWriter to write out the JSON string to a more
readable
                // format.
                return policy.toJson(IamPolicyWriter.builder()
                                .prettyPrint(true)
                                .build());
        }
```

Create a policy with multiple conditions.

```
        public String multipleConditionsExample() {
                IamPolicy policy = IamPolicy.builder()
                                .addStatement(b -> b
                                                .effect(IamEffect.ALLOW)
                                                .addAction("dynamodb:GetItem")

.addAction("dynamodb:BatchGetItem")
                                                .addAction("dynamodb:Query")
                                                .addAction("dynamodb:PutItem")
                                                .addAction("dynamodb:UpdateItem")
                                                .addAction("dynamodb:DeleteItem")

.addAction("dynamodb:BatchWriteItem")

.addResource("arn:aws:dynamodb:*:*:table/table-name")
```

```
 .addConditions(IamConditionOperator.STRING_EQUALS

 .addPrefix("ForAllValues:"),

 "dynamodb:Attributes",
                                                                    List.of("column-
name1", "column-name2", "column-name3"))
                                                .addCondition(b1 -> b1

 .operator(IamConditionOperator.STRING_EQUALS

 .addSuffix("IfExists"))

 .key("dynamodb:Select")

 .value("SPECIFIC_ATTRIBUTES")))
                                .build();

                return policy.toJson(IamPolicyWriter.builder()
                                .prettyPrint(true).build());
        }
```

Use principals in a policy.

```
        public String specifyPrincipalsExample() {
                IamPolicy policy = IamPolicy.builder()
                                .addStatement(b -> b
                                                .effect(IamEffect.DENY)
                                                .addAction("s3:*")
                                                .addPrincipal(IamPrincipal.ALL)
                                                .addResource("arn:aws:s3:::amzn-
s3-demo-bucket/*")
                                                .addResource("arn:aws:s3:::amzn-
s3-demo-bucket")
                                                .addCondition(b1 -> b1

 .operator(IamConditionOperator.ARN_NOT_EQUALS)

 .key("aws:PrincipalArn")

 .value("arn:aws:iam::444455556666:user/user-name")))
```

```
                                .build();
                return policy.toJson(IamPolicyWriter.builder()
                                .prettyPrint(true).build());
        }
```

Allow cross-account access.

```
        public String allowCrossAccountAccessExample() {
                IamPolicy policy = IamPolicy.builder()
                                .addStatement(b -> b
                                                .effect(IamEffect.ALLOW)

 .addPrincipal(IamPrincipalType.AWS, "111122223333")
                                                .addAction("s3:PutObject")
                                                .addResource("arn:aws:s3:::amzn-
s3-demo-bucket/*")
                                                .addCondition(b1 -> b1

 .operator(IamConditionOperator.STRING_EQUALS)
                                                                .key("s3:x-amz-
acl")
                                                                .value("bucket-
owner-full-control")))
                                .build();
                return policy.toJson(IamPolicyWriter.builder()
                                .prettyPrint(true).build());
        }
```

Build and upload an `IamPolicy`.

```
        public String createAndUploadPolicyExample(IamClient iam, String
 accountID, String policyName) {
                // Build the policy.
                IamPolicy policy = IamPolicy.builder() // 'version' defaults to
 "2012-10-17".
                                .addStatement(IamStatement.builder()
                                                .effect(IamEffect.ALLOW)
                                                .addAction("dynamodb:PutItem")

 .addResource("arn:aws:dynamodb:us-east-1:" + accountID
```

```
                                                                    + ":table/
exampleTableName")
                                                .build())
                                .build();
                // Upload the policy.
                iam.createPolicy(r ->
 r.policyName(policyName).policyDocument(policy.toJson()));
                return
 policy.toJson(IamPolicyWriter.builder().prettyPrint(true).build());
        }
```

Download and work with an `IamPolicy`.

```
        public String createNewBasedOnExistingPolicyExample(IamClient iam, String
 accountID, String policyName,
                        String newPolicyName) {

                String policyArn = "arn:aws:iam::" + accountID + ":policy/" +
 policyName;
                GetPolicyResponse getPolicyResponse = iam.getPolicy(r ->
 r.policyArn(policyArn));

                String policyVersion =
 getPolicyResponse.policy().defaultVersionId();
                GetPolicyVersionResponse getPolicyVersionResponse = iam
                                .getPolicyVersion(r ->
 r.policyArn(policyArn).versionId(policyVersion));

                // Create an IamPolicy instance from the JSON string returned
 from IAM.
                String decodedPolicy =
 URLDecoder.decode(getPolicyVersionResponse.policyVersion().document(),
                                StandardCharsets.UTF_8);
                IamPolicy policy = IamPolicy.fromJson(decodedPolicy);

                /*
                 * All IamPolicy components are immutable, so use the copy method
 that creates a
                 * new instance that
                 * can be altered in the same method call.
                 *
```

```
                 * Add the ability to get an item from DynamoDB as an additional
action.
                 */
                IamStatement newStatement = policy.statements().get(0).copy(s ->
s.addAction("dynamodb:GetItem"));

                // Create a new statement that replaces the original statement.
                IamPolicy newPolicy = policy.copy(p ->
p.statements(Arrays.asList(newStatement)));

                // Upload the new policy. IAM now has both policies.
                iam.createPolicy(r -> r.policyName(newPolicyName)
                                .policyDocument(newPolicy.toJson()));

                return
newPolicy.toJson(IamPolicyWriter.builder().prettyPrint(true).build());
        }
```

  - GetPolicy
  - GetPolicyVersion

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Code examples for AWS STS using AWS SDKs

The following code examples show how to use AWS STS with an AWS software development kit (SDK).

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Code examples

- Basic examples for AWS STS using AWS SDKs
  - Actions for AWS STS using AWS SDKs
    - Use AssumeRole with an AWS SDK or CLI
    - Use AssumeRoleWithWebIdentity with a CLI
    - Use DecodeAuthorizationMessage with a CLI
    - Use GetFederationToken with a CLI
    - Use GetSessionToken with an AWS SDK or CLI
- Scenarios for AWS STS using AWS SDKs
  - Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK
  - Construct a URL with AWS STS for federated users using an AWS SDK
  - Get a session token that requires an MFA token with AWS STS using an AWS SDK

Basic examples for AWS STS using AWS SDKs

The following code examples show how to use the basics of AWS Security Token Service with AWS SDKs.

Examples

- Actions for AWS STS using AWS SDKs
  - Use AssumeRole with an AWS SDK or CLI
  - Use AssumeRoleWithWebIdentity with a CLI
  - Use DecodeAuthorizationMessage with a CLI
  - Use GetFederationToken with a CLI
  - Use GetSessionToken with an AWS SDK or CLI

Actions for AWS STS using AWS SDKs

The following code examples demonstrate how to perform individual AWS STS actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the AWS STS API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for AWS STS using AWS SDKs .

The following examples include only the most commonly used actions. For a complete list, see the AWS Security Token Service API Reference.

Examples

- Use AssumeRole with an AWS SDK or CLI
- Use AssumeRoleWithWebIdentity with a CLI
- Use DecodeAuthorizationMessage with a CLI
- Use GetFederationToken with a CLI
- Use GetSessionToken with an AWS SDK or CLI

Use `AssumeRole` with an AWS SDK or CLI

The following code examples show how to use `AssumeRole`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Assume an IAM role that requires an MFA token
- Construct a URL for federated users

using Amazon.SecurityToken;
using Amazon.SecurityToken.Model;

namespace AssumeRoleExample
{
    class AssumeRole
    {
        /// <summary>
        /// This example shows how to use the AWS Security Token
        /// Service (AWS STS) to assume an IAM role.
        ///
        /// NOTE: It is important that the role that will be assumed has a
        /// trust relationship with the account that will assume the role.
        ///
        /// Before you run the example, you need to create the role you want to
        /// assume and have it trust the IAM account that will assume that role.
        ///
        /// See https://docs.aws.amazon.com/IAM/latest/UserGuide/
id_roles_create.html
        /// for help in working with roles.
        /// </summary>

        // A region property may be used if the profile or credentials loaded do
 not specify a region,
        // or to use a specific region.
        private static readonly RegionEndpoint REGION = RegionEndpoint.USWest2;

        static async Task Main()
        {
            // Create the SecurityToken client and then display the identity of
 the
            // default user.
            var roleArnToAssume = "arn:aws:iam::123456789012:role/
testAssumeRole";

            var client = new
 Amazon.SecurityToken.AmazonSecurityTokenServiceClient(REGION);

            // Get and display the information about the identity of the default
 user.
```

```
            var callerIdRequest = new GetCallerIdentityRequest();
            var caller = await client.GetCallerIdentityAsync(callerIdRequest);
            Console.WriteLine($"Original Caller: {caller.Arn}");

            // Create the request to use with the AssumeRoleAsync call.
            var assumeRoleReq = new AssumeRoleRequest()
            {
                DurationSeconds = 1600,
                RoleSessionName = "Session1",
                RoleArn = roleArnToAssume
            };

            var assumeRoleRes = await client.AssumeRoleAsync(assumeRoleReq);

            // Now create a new client based on the credentials of the caller
 assuming the role.
            var client2 = new AmazonSecurityTokenServiceClient(credentials:
 assumeRoleRes.Credentials, REGION);

            // Get and display information about the caller that has assumed the
 defined role.
            var caller2 = await client2.GetCallerIdentityAsync(callerIdRequest);
            Console.WriteLine($"AssumedRole Caller: {caller2.Arn}");
        }
    }
}
```

- For API details, see AssumeRole in *AWS SDK for .NET API Reference*.

Bash

AWS CLI with Bash script

        credentials.SetAWSSecretKey(temp_credentials.GetSecretAccessKey());
        credentials.SetSessionToken(temp_credentials.GetSessionToken());
    }
```

```
    return outcome.IsSuccess();
}
```

- For API details, see AssumeRole in *AWS SDK for C++ API Reference*.

CLI

AWS CLI

To assume a role

The following `assume-role` command retrieves a set of short-term credentials for the IAM role `s3-access-example`.

```
aws sts assume-role \
    --role-arn arn:aws:iam::123456789012:role/xaccounts3access \
    --role-session-name s3-access-example
```

Output:

```
{
    "AssumedRoleUser": {
        "AssumedRoleId": "AROA3XFRBF535PLBIFPI4:s3-access-example",
        "Arn": "arn:aws:sts::123456789012:assumed-role/xaccounts3access/s3-
access-example"
    },
    "Credentials": {
        "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
        "SessionToken": "AQoXdzELDDY//////////
wEaoAK1wvxJY12r2IrDFT2IvAzTCn3zHoZ7YNtpiQLF0MqZye/
qwjzP2iEXAMPLEbw/m3hsj8VBTkPORGvr9jM5sgP+w9IZWZnU+LWhmg
+a5fDi2oTGUYcdg9uexQ4mtCHIHfi4citgqZTgco40Yqr4lIlo4V2b2Dyauk0eYFNebHtYlFVgAUj
+7Indz3LU0aTWk1WKIjHmmMCIoTkyYp/k7kUG7moeEYKSitwQIi6Gjn+nyzM
+PtoA3685ixzv0R7i5rjQi0YE0lf1oeie3bDiNHncmzosRM6SFiPzSvp6h/32xQuZsjcypmwsPSDtTPYcs0+YN/8B
IcrxSpnWEXAMPLEXSDFTAQAM6Dl9zR0tXoybnlrZIwMLlMi1Kcgo5OytwU=",
        "Expiration": "2016-03-15T00:05:07Z",
        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
    }
}
```

The output of the command contains an access key, secret key, and session token that you can use to authenticate to AWS.

For AWS CLI use, you can set up a named profile associated with a role. When you use the profile, the AWS CLI will call assume-role and manage credentials for you. For more information, see Use an IAM role in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see AssumeRole in *AWS CLI Command Reference*.

Create the client.

```
import { STSClient } from "@aws-sdk/client-sts";
// Set the AWS Region.
const REGION = "us-east-1";
// Create an AWS STS service client object.
export const client = new STSClient({ region: REGION });
```

Assume the IAM role.

```
import { AssumeRoleCommand } from "@aws-sdk/client-sts";

import { client } from "../libs/client.js";

export const main = async () => {
  try {
    // Returns a set of temporary security credentials that you can use to
    // access Amazon Web Services resources that you might not normally
    // have access to.
    const command = new AssumeRoleCommand({
      // The Amazon Resource Name (ARN) of the role to assume.
      RoleArn: "ROLE_ARN",
      // An identifier for the assumed role session.
      RoleSessionName: "session1",
      // The duration, in seconds, of the role session. The value specified
      // can range from 900 seconds (15 minutes) up to the maximum session
      // duration set for the role.
      DurationSeconds: 900,
    });
    const response = await client.send(command);
    console.log(response);
```

```
  } catch (err) {
    console.error(err);
  }
};
```

>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// Load the AWS SDK for Node.js
const AWS = require("aws-sdk");
// Set the region
AWS.config.update({ region: "REGION" });

var roleToAssume = {
  RoleArn: "arn:aws:iam::123456789012:role/RoleName",
  RoleSessionName: "session1",
  DurationSeconds: 900,
};
var roleCreds;

// Create the STS service object
var sts = new AWS.STS({ apiVersion: "2011-06-15" });

//Assume Role
sts.assumeRole(roleToAssume, function (err, data) {
  if (err) console.log(err, err.stack);
  else {
    roleCreds = {
      accessKeyId: data.Credentials.AccessKeyId,
      secretAccessKey: data.Credentials.SecretAccessKey,
      sessionToken: data.Credentials.SessionToken,
    };
    stsGetCallerIdentity(roleCreds);
  }
});
```

```
//Get Arn of current identity
function stsGetCallerIdentity(creds) {
  var stsParams = { credentials: creds };
  // Create STS service object
  var sts = new AWS.STS(stsParams);

  sts.getCallerIdentity({}, function (err, data) {
    if (err) {
      console.log(err, err.stack);
    } else {
      console.log(data.Arn);
    }
  });
}
```

- For API details, see AssumeRole in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Returns a set of temporary credentials (access key, secret key and session token) that can be used for one hour to access AWS resources that the requesting user might not normally have access to. The returned credentials have the permissions that are allowed by the access policy of the role being assumed and the policy that was supplied (you cannot use the supplied policy to grant permissions in excess of those defined by the access policy of the role being assumed).

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -Policy "...JSON policy..." -DurationInSeconds 3600
```

Example 2: Returns a set of temporary credentials, valid for one hour, that have the same permissions that are defined in the access policy of the role being assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600
```

Example 3: Returns a set of temporary credentials supplying the serial number and generated token from an MFA associated with the user credentials used to execute the cmdlet.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600 -SerialNumber "GAHT12345678" -TokenCode "123456"
```

Example 4: Returns a set of temporary credentials that have assumed a role defined in a customer account. For each role that the third party can assume, the customer account must create a role using an identifier that must be passed in the -ExternalId parameter each time the role is assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600 -ExternalId "ABC123"
```

- For API details, see AssumeRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns a set of temporary credentials (access key, secret key and session token) that can be used for one hour to access AWS resources that the requesting user might not normally have access to. The returned credentials have the permissions that are allowed by the access policy of the role being assumed and the policy that was supplied (you cannot use the supplied policy to grant permissions in excess of those defined by the access policy of the role being assumed).

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -Policy "...JSON policy..." -DurationInSeconds 3600
```

Example 2: Returns a set of temporary credentials, valid for one hour, that have the same permissions that are defined in the access policy of the role being assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600
```

Example 3: Returns a set of temporary credentials supplying the serial number and generated token from an MFA associated with the user credentials used to execute the cmdlet.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600 -SerialNumber "GAHT12345678" -TokenCode "123456"
```

Example 4: Returns a set of temporary credentials that have assumed a role defined in a customer account. For each role that the third party can assume, the customer account must create a role using an identifier that must be passed in the -ExternalId parameter each time the role is assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo"
 -DurationInSeconds 3600 -ExternalId "ABC123"
```

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Assume an IAM role that requires an MFA token and use temporary credentials to list Amazon S3 buckets for the account.

```
def list_buckets_from_assumed_role_with_mfa(
    assume_role_arn, session_name, mfa_serial_number, mfa_totp, sts_client
):
    """
    Assumes a role from another account and uses the temporary credentials from
    that role to list the Amazon S3 buckets that are owned by the other account.
    Requires an MFA device serial number and token.

    The assumed role must grant permission to list the buckets in the other
 account.

    :param assume_role_arn: The Amazon Resource Name (ARN) of the role that
                            grants access to list the other account's buckets.
```

```
    :param session_name: The name of the STS session.
    :param mfa_serial_number: The serial number of the MFA device. For a virtual
MFA
                              device, this is an ARN.
    :param mfa_totp: A time-based, one-time password issued by the MFA device.
    :param sts_client: A Boto3 STS instance that has permission to assume the
role.
    """
    response = sts_client.assume_role(
        RoleArn=assume_role_arn,
        RoleSessionName=session_name,
        SerialNumber=mfa_serial_number,
        TokenCode=mfa_totp,
    )
    temp_credentials = response["Credentials"]
    print(f"Assumed role {assume_role_arn} and got temporary credentials.")

    s3_resource = boto3.resource(
        "s3",
        aws_access_key_id=temp_credentials["AccessKeyId"],
        aws_secret_access_key=temp_credentials["SecretAccessKey"],
        aws_session_token=temp_credentials["SessionToken"],
    )

    print(f"Listing buckets for the assumed role's account:")

Use `AssumeRoleWithWebIdentity` with a CLI

The following code examples show how to use `AssumeRoleWithWebIdentity`.

CLI

AWS CLI

To get short-term credentials for a role authenticated with Web Identity (OAuth 2."0)

The following `assume-role-with-web-identity` command retrieves a set of short-term credentials for the IAM role `app1`. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to

the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```
aws sts assume-role-with-web-identity \
    --duration-seconds 3600 \
    --role-session-name "app1" \
    --provider-id "www.amazon.com" \
    --policy-arns "arn:aws:iam::123456789012:policy/
q=webidentitydemopolicy1","arn:aws:iam::123456789012:policy/
webidentitydemopolicy2" \
    --role-arn arn:aws:iam::123456789012:role/FederatedWebIdentityRole \
    --web-identity-token "Atza
%7CIQEBLjAsAhRFiXuWpUXuRvQ9PZL3GMFcYevydwIUFAHZwXZXXXXXXXXJnrulxKDHwy87oGKPznh0D6bEQZTSCz
CrKqjG7nPBjNIL016GGvuS5gSvPRUxWES3VYfm1wl7WTI7jn-Pcb6M-
buCgHhFOzTQxod27L9CqnOLio7N3gZAGpsp6n1-
AJBOCJckcyXe2c6uD0srOJeZlKUm2eTDVMf8IehDVI0r1QOnTV6KzzAI3OY87Vd_cVMQ"
```

Output:

```
{
    "SubjectFromWebIdentityToken": "amzn1.account.AF6RHO7KZU5XRVQJGXK6HB56KR2A",
    "Audience": "client.5498841531868486423.1548@apps.example.com",
    "AssumedRoleUser": {

```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see AssumeRoleWithWebIdentity in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Returns a temporary set of credentials, valid for one hour, for a user who has been authenticated with the Login with Amazon identity provider. The credentials assume the access policy associated with the role identified by the role ARN. Optionally, you can pass a JSON policy to the -Policy parameter that further refine the access permissions (you cannot grant more permissions than are available in the permissions associated with the role). The value supplied to the -WebIdentityToken is the unique user identifier that was returned by the identity provider.

```
Use-STSWebIdentityRole -DurationInSeconds 3600 -ProviderId "www.amazon.com"
 -RoleSessionName "app1" -RoleArn "arn:aws:iam::123456789012:role/
FederatedWebIdentityRole" -WebIdentityToken "Atza...DVI0r1"
```

- For API details, see AssumeRoleWithWebIdentity in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns a temporary set of credentials, valid for one hour, for a user who has been authenticated with the Login with Amazon identity provider. The credentials assume the access policy associated with the role identified by the role ARN. Optionally, you can pass a JSON policy to the -Policy parameter that further refine the access permissions (you cannot grant more permissions than are available in the permissions associated with the role). The value supplied to the -WebIdentityToken is the unique user identifier that was returned by the identity provider.

```
Use-STSWebIdentityRole -DurationInSeconds 3600 -ProviderId "www.amazon.com"
 -RoleSessionName "app1" -RoleArn "arn:aws:iam::123456789012:role/
FederatedWebIdentityRole" -WebIdentityToken "Atza...DVI0r1"
```

- For API details, see AssumeRoleWithWebIdentity in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use DecodeAuthorizationMessage with a CLI

The following code examples show how to use DecodeAuthorizationMessage.

CLI

AWS CLI

To decode an encoded authorization message returned in response to a request

The following decode-authorization-message example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```
aws sts decode-authorization-message \
    --encoded-message EXAMPLEWodyRNrtlQARDip-
eTA6i6DrlUhHhPQrLWB_lAbl5pAKxl9mPDLexYcGBreyIKQC1BGBIpBKr3dFDkwqeO7e2NMk5j_hmzAiChJN-8oy3

- For API details, see DecodeAuthorizationMessage in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Decodes the additional information contained in the supplied encoded message content that was returned in response to a request. The additional information is encoded because details of the authorization status can constitute privileged information that the user who requested the action should not see.

```
Convert-STSAuthorizationMessage -EncodedMessage "...encoded message..."
```

- For API details, see DecodeAuthorizationMessage in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Decodes the additional information contained in the supplied encoded message content that was returned in response to a request. The additional information is encoded because details of the authorization status can constitute privileged information that the user who requested the action should not see.

```
Convert-STSAuthorizationMessage -EncodedMessage "...encoded message..."
```

- For API details, see DecodeAuthorizationMessage in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetFederationToken` with a CLI

The following code examples show how to use `GetFederationToken`.

CLI

AWS CLI

To return a set of temporary security credentials using IAM user access key credentials

The following `get-federation-token` example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the `GetFederationToken` operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
    --name Bob \
    --policy file://myfile.json \
    --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
    --duration-seconds 900
```

Contents of `myfile.json`:

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:Describe*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "elasticloadbalancing:Describe*",
```

```
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:ListMetrics",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:Describe*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "autoscaling:Describe*",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "EXAMPLEpZ2luX2VjEGoaCXVzLXdlc3QtMiJIMEYCIQC/

        "FederatedUserId": "111122223333:Bob",
        "Arn": "arn:aws:sts::111122223333:federated-user/Bob"
    },
    "PackedPolicySize": 36
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see GetFederationToken in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Requests a federated token valid for one hour using "Bob" as the name of the federated user. This name can be used to reference the federated user name in a resource-based policy (such as an Amazon S3 bucket policy). The supplied IAM policy, in JSON format, is used to scope down the permissions that are available to the IAM user. The supplied policy cannot grant more permissions than those granted to the requesting user, with the final permissions for the federated user being the most restrictive set based on the intersection of the passed policy and the IAM user policy.

```
Get-STSFederationToken -Name "Bob" -Policy "...JSON policy..." -DurationInSeconds
 3600
```

- For API details, see GetFederationToken in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Requests a federated token valid for one hour using "Bob" as the name of the federated user. This name can be used to reference the federated user name in a resource-based policy (such as an Amazon S3 bucket policy). The supplied IAM policy, in JSON format, is used to scope down the permissions that are available to the IAM user. The supplied policy cannot grant more permissions than those granted to the requesting user, with the final permissions for the federated user being the most restrictive set based on the intersection of the passed policy and the IAM user policy.

```
Get-STSFederationToken -Name "Bob" -Policy "...JSON policy..." -DurationInSeconds
 3600
```

- For API details, see GetFederationToken in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetSessionToken` with an AWS SDK or CLI

The following code examples show how to use `GetSessionToken`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Get a session token that requires an MFA token

CLI

AWS CLI

To get a set of short term credentials for an IAM identity

The following `get-session-token` command retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```
aws sts get-session-token \
    --duration-seconds 900 \
    --serial-number "YourMFADeviceSerialNumber" \
    --token-code 123456
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4BlCFFxWNE1OPTgk5TthT

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get a session token by passing an MFA token and use it to list Amazon S3 buckets for the account.

```
def list_buckets_with_session_token_with_mfa(mfa_serial_number, mfa_totp,
 sts_client):
    """
    Gets a session token with MFA credentials and uses the temporary session
    credentials to list Amazon S3 buckets.

    Requires an MFA device serial number and token.

    :param mfa_serial_number: The serial number of the MFA device. For a virtual
 MFA
                              device, this is an Amazon Resource Name (ARN).
    :param mfa_totp: A time-based, one-time password issued by the MFA device.
    :param sts_client: A Boto3 STS instance that has permission to assume the
 role.
    """
    if mfa_serial_number is not None:
        response = sts_client.get_session_token(
            SerialNumber=mfa_serial_number, TokenCode=mfa_totp
        )
    else:
        response = sts_client.get_session_token()
    temp_credentials = response["Credentials"]

    s3_resource = boto3.resource(
        "s3",
        aws_access_key_id=temp_credentials["AccessKeyId"],
        aws_secret_access_key=temp_credentials["SecretAccessKey"],
        aws_session_token=temp_credentials["SessionToken"],
    )

    print(f"Buckets for the account:")
    for bucket in s3_resource.buckets.all():
        print(bucket.name)
```

- For API details, see GetSessionToken in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for AWS STS using AWS SDKs

The following code examples show you how to implement common scenarios in AWS STS with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within AWS STS or combined with other AWS services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK
- Construct a URL with AWS STS for federated users using an AWS SDK
- Get a session token that requires an MFA token with AWS STS using an AWS SDK

Assume an IAM role that requires an MFA token with AWS STS using an AWS SDK

The following code example shows how to assume a role that requires an MFA token.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create an IAM role that grants permission to list Amazon S3 buckets.
- Create an IAM user that has permission to assume the role only when MFA credentials are provided.
- Register an MFA device for the user.
- Assume the role and use temporary credentials to list S3 buckets.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user, register an MFA device, and create a role that grants permission to list S3 buckets. The user has rights only to assume the role.

```
def setup(iam_resource):
    """
    Creates a new user with no permissions.
    Creates a new virtual MFA device.
    Displays the QR code to seed the device.
    Asks for two codes from the MFA device.
    Registers the MFA device for the user.
    Creates an access key pair for the user.
    Creates a role with a policy that lets the user assume the role and requires
 MFA.
    Creates a policy that allows listing Amazon S3 buckets.
    Attaches the policy to the role.
    Creates an inline policy for the user that lets the user assume the role.

    For demonstration purposes, the user is created in the same account as the
 role,
    but in practice the user would likely be from another account.

    Any MFA device that can scan a QR code will work with this demonstration.
    Common choices are mobile apps like LastPass Authenticator,
    Microsoft Authenticator, or Google Authenticator.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM)
 resource
                         that has permissions to create users, roles, and
 policies
                         in the account.
    :return: The newly created user, user key, virtual MFA device, and role.
    """
```

```
    user = iam_resource.create_user(UserName=unique_name("user"))
    print(f"Created user {user.name}.")

    virtual_mfa_device = iam_resource.create_virtual_mfa_device(
        VirtualMFADeviceName=unique_name("mfa")
    )
    print(f"Created virtual MFA device {virtual_mfa_device.serial_number}")

    print(
        f"Showing the QR code for the device. Scan this in the MFA app of your "
        f"choice."
    )
    with open("qr.png", "wb") as qr_file:
        qr_file.write(virtual_mfa_device.qr_code_png)
    webbrowser.open(qr_file.name)

    print(f"Enter two consecutive code from your MFA device.")
    mfa_code_1 = input("Enter the first code: ")
    mfa_code_2 = input("Enter the second code: ")
    user.enable_mfa(
        SerialNumber=virtual_mfa_device.serial_number,
        AuthenticationCode1=mfa_code_1,
        AuthenticationCode2=mfa_code_2,
    )
    os.remove(qr_file.name)

Construct a URL with AWS STS for federated users using an AWS SDK

The following code example shows how to:

- Create an IAM role that grants read-only access to the current account's Amazon S3 resources.
- Get a security token from the AWS federation endpoint.
- Construct a URL that can be used to access the console with federated credentials.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a role that grants read-only access to the current account's S3 resources.

```
def setup(iam_resource):
    """
    Creates a role that can be assumed by the current user.
    Attaches a policy that allows only Amazon S3 read-only access.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM)
 instance
                         that has the permission to create a role.
    :return: The newly created role.
    """

Get a session token that requires an MFA token with AWS STS using an AWS SDK

The following code example shows how to get a session token that requires an MFA token.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create an IAM role that grants permission to list Amazon S3 buckets.
- Create an IAM user that has permission to assume the role only when MFA credentials are provided.
- Register an MFA device for the user.
- Provide MFA credentials to get a session token and use temporary credentials to list S3 buckets.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create an IAM user, register an MFA device, and create a role that grants permission to let the user list S3 buckets only when MFA credentials are used.

```
def setup(iam_resource):
    """
```

```
    Creates a new user with no permissions.
    Creates a new virtual multi-factor authentication (MFA) device.
    Displays the QR code to seed the device.
    Asks for two codes from the MFA device.
    Registers the MFA device for the user.
    Creates an access key pair for the user.
    Creates an inline policy for the user that lets the user list Amazon S3
buckets,
    but only when MFA credentials are used.

    Any MFA device that can scan a QR code will work with this demonstration.
    Common choices are mobile apps like LastPass Authenticator,
    Microsoft Authenticator, or Google Authenticator.

    :param iam_resource: A Boto3 AWS Identity and Access Management (IAM)
resource
                         that has permissions to create users, MFA devices, and
                         policies in the account.
    :return: The newly created user, user key, and virtual MFA device.
    """

            list_buckets_with_session_token_with_mfa(None, None, sts_client)
        except ClientError as error:
            if error.response["Error"]["Code"] == "AccessDenied":
                print("Got expected AccessDenied error.")
        mfa_totp = input("Enter the code from your registered MFA device: ")
        list_buckets_with_session_token_with_mfa(
```

```
            virtual_mfa_device.serial_number, mfa_totp, sts_client
        )
    finally:
        teardown(user, virtual_mfa_device)
        print("Thanks for watching!")
```

- For API details, see GetSessionToken in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Security in IAM and AWS STS

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the .
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using AWS Identity and Access Management (IAM) and AWS Security Token Service (AWS STS). The following topics show you how to configure IAM and AWS STS to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your IAM resources.

Contents

- AWS security credentials

- Security features outside IAM

AWS security credentials

When you interact with AWS, you specify your AWS *security credentials* to verify who you are and whether you have permission to access the resources that you are requesting. AWS uses the security credentials to authenticate and authorize your requests.

For example, if you want to download a protected file from an Amazon Simple Storage Service (Amazon S3) bucket, your credentials must allow that access. If your credentials don't show you are authorized to download the file, AWS denies your request. However, your AWS security credentials aren't required for you to download a file in an Amazon S3 bucket that is publicly shared.

There are different types of users in AWS, each with their own security credentials:

- **Account owner (root user)** — The user who created the AWS account and has full access.
- **AWS IAM Identity Center users** — Users managed in AWS IAM Identity Center.
- **Federated principals** — Users from external identity providers who are granted temporary access to AWS through federation. For more information about federated identities, see Identity providers and federation into AWS.
- **IAM users** — Individual users created within the AWS Identity and Access Management (IAM) service.

Users have either long-term or temporary security credentials. Root user, IAM user, and access keys have long-term security credentials that do not expire. To protect long-term credentials have processes in place to manage access keys, change passwords, and enable MFA.

To simplify managing root user credentials across member accounts in AWS Organizations, you can centrally secure the root user credentials of your AWS accounts managed using AWS Organizations. Centrally manage root access for member accounts lets you centrally remove and prevent long-term root user credential recovery, preventing unintended root access at scale.

IAM roles, users in AWS IAM Identity Center, and AWS STS federated user principals have temporary security credentials. Temporary security credentials expire after a defined period of time or when the user ends their session. Temporary credentials work almost identically to long-term credentials, with the following differences:

- Temporary security credentials are *short-term*, as the name implies. They can be configured to last for anywhere from a few minutes to several hours. After the credentials expire, AWS no longer recognizes them or allows any kind of access from API requests made with them.

- Temporary security credentials are not stored with the user but are generated dynamically and provided to the user when requested. When (or even before) the temporary security credentials expire, the user can request new credentials, as long as the user requesting them still has permissions to do so.

As a result, temporary credentials have the following advantages over long-term credentials:

- You do not have to distribute or embed long-term AWS security credentials with an application.
- You can provide access to your AWS resources to users without having to define an AWS identity for them. Temporary credentials are the basis for roles and identity federation.
- The temporary security credentials have a limited lifetime, so you do not have to update them or explicitly revoke them when they're no longer needed. After temporary security credentials expire, they cannot be reused. You can specify how long the credentials are valid, up to a maximum limit.

Security considerations

We recommend that you consider the following information when determining the security provisions for your AWS account:

- When you create an AWS account, we create the account root user. The credentials of the root user (account owner) allow full access to all resources in the account. The first task you perform with the root user is to grant another user administrative permissions to your AWS account so that you minimize the usage of the root user.
- Multi-factor authentication (MFA) provides an extra level of security for users who can access your AWS account. For additional security, we recommend that you require MFA on the AWS account root user credentials and all IAM users. For more information, see AWS Multi-factor authentication in IAM.
- AWS requires different types of security credentials, depending on how you access AWS and what type of AWS user you are. For example, you use sign-in credentials for the AWS Management Console while you use access keys to make programmatic calls to AWS. For help determining your user type and sign-in page, see What is AWS Sign-In in the *AWS Sign-In User Guide*.
- You can't use IAM policies to deny the root user access to resources explicitly. You can only use an AWS Organizations service control policy (SCP) to limit the permissions of the root user.

- If you forget or lose your root user password, you must have access to the email address associated with your account in order to reset it.
- If you lose your root user access keys, you must be able to sign in to your account as the root user to create new ones.
- Do not use the root user for your everyday tasks. Use it to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials.
- Security credentials are account-specific. If you have access to multiple AWS accounts, you have separate credentials for each account.
- Policies determine what actions a user, role, or member of a user group can perform, on which AWS resources, and under what conditions. Using policies you can securely control access to AWS services and resources in your AWS account. If you must modify or revoke permissions in response to a security event, you delete or modify the policies instead of making changes directly to the identity.
- Be sure to save the sign-in credentials for your *Emergency Access* IAM user and any access keys you created for programmatic access in a secure location. If you lose your access keys, you must sign in to your account to create new ones.
- We strongly recommend that you use temporary credentials provided by IAM roles and federated principals instead of the long-term credentials provided by IAM users and access keys.

Programmatic access with AWS security credentials

We recommend using short-term access keys when possible to make programmatic calls to AWS or to use the AWS Command Line Interface or AWS Tools for PowerShell. However, you can also use long-term AWS access keys for these purposes.

When you create a long-term access key, you create the access key ID (for example, `AKIAIOSFODNN7EXAMPLE`) and secret access key (for example, `wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`) as a set. The secret access key is available for download only when you create it. If you don't download your secret access key or if you lose it, you must create a new one.

In many scenarios, you don't need long-term access keys that never expire (as you have when you create access keys for an IAM user). Instead, you can create IAM roles and generate temporary security credentials. Temporary security credentials include an access key ID and a secret access key, but they also include a security token that indicates when the credentials expire. After they expire, they're no longer valid. For more information, see Alternatives to long-term access keys

Access key IDs beginning with `AKIA` are long-term access keys for an IAM user or an AWS account root user. Access key IDs beginning with `ASIA` are temporary credentials access keys that you create using AWS STS operations.

Users need programmatic access if they want to interact with AWS outside of the AWS Management Console. The way to grant programmatic access depends on the type of user that's accessing AWS.

To grant users programmatic access, choose one of the following options.

Which user needs programmatic access?	To	By
IAM	(Recommended) Use console credentials as temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Login for AWS local development in the *AWS Command Line Interface User Guide*. • For AWS SDKs, see Login for AWS local development in the *AWS SDKs and Tools Reference Guide*.
Workforce identity (Users managed in IAM Identity Center)	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Configuring the AWS CLI to use AWS IAM Identity Center in the *AWS Command Line Interface User Guide*. • For AWS SDKs, tools, and AWS APIs, see IAM Identity

Which user needs programmatic access?	To	By
		Center authentication in the *AWS SDKs and Tools Reference Guide*.
IAM	Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions in Using temporary credentials with AWS resources in the *IAM User Guide*.
IAM	(Not recommended) Use long-term credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.	Following the instructions for the interface that you want to use. • For the AWS CLI, see Authenticating using IAM user credentials in the *AWS Command Line Interface User Guide*. • For AWS SDKs and tools, see Authenticate using long-term credentials in the *AWS SDKs and Tools Reference Guide*. • For AWS APIs, see Managing access keys for IAM users in the *IAM User Guide*.

Alternatives to long-term access keys

For many common use cases, there are alternatives to long-term access keys. To improve your account security, consider the following.

- **Don't embed long-term access keys and secret access keys in your application code or in a code repository –** Instead, use AWS Secrets Manager, or other secrets management solution, so you don't have to hardcode keys in plaintext. The application or client can then retrieve secrets when needed. For more information, see What is AWS Secrets Manager? in the *AWS Secrets Manager User Guide*.

- **Use IAM roles to generate temporary security credentials whenever possible –** Always use mechanisms to issue temporary security credentials when possible, rather than long-term access keys. Temporary security credentials are more secure because they are not stored with the user but are generated dynamically and provided to the user when requested. Temporary security credentials have a limited lifetime so you don't have to manage or update them. Mechanisms that provide temporary access keys include IAM roles or the authentication of an IAM Identity Center user. For machines that run outside of AWS you can use AWS Identity and Access Management Roles Anywhere.
- **Use alternatives to long-term access keys for the AWS Command Line Interface (AWS CLI) or the `aws-shell` –** Alternatives include the following.
  - **Login for AWS local development with console credentials**. You can use the AWS CLI Version 2 and the `aws login` command to generate short-term credentials to run AWS CLI commands using your console credentials. To learn more, see Login for AWS local development in the *AWS Command Line Interface User Guide*.
  - **AWS CloudShell** is a browser-based, pre-authenticated shell that you can launch directly from the AWS Management Console. You can run AWS CLI commands against AWS services through your preferred shell (Bash, Powershell, or Z shell). When you do this, you don't need to download or install command line tools. For more information, see What is AWS CloudShell? in the *AWS CloudShell User Guide*.
- **Don't create long-term access keys for human users who need access to applications or AWS services –** IAM Identity Center can generate temporary access credentials for your external IdP users to access AWS services. This eliminates the need to create and manage long-term credentials in IAM. In IAM Identity Center, create an IAM Identity Center permission set that grants the external IdP users access. Then assign a group from IAM Identity Center to the permission set in the selected AWS accounts. For more information, see What is AWS IAM Identity Center, Connect to your external identity provider, and Permission sets in the *AWS IAM Identity Center User Guide*.
- **Don't store long-term access keys within an AWS compute service –** Instead, assign an IAM role to compute resources. This automatically supplies temporary credentials to grant access.

For example, when you create an instance profile that is attached to an Amazon EC2 instance, you can assign an AWS role to the instance and make it available to all of its applications. An instance profile contains the role and enables programs that are running on the Amazon EC2 instance to get temporary credentials. To learn more, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances.

AWS security audit guidelines

Periodically audit your security configuration to make sure it meets your current business needs. An audit gives you an opportunity to remove unneeded IAM users, roles, groups, and policies, and to make sure that your users and software don't have excessive permissions.

Following are guidelines for systematically reviewing and monitoring your AWS resources for security best practices.

> **Tip**
>
> You can monitor your usage of IAM as it relates to security best practices by using AWS Security Hub CSPM. Security Hub CSPM uses security controls to evaluate resource configurations and security standards to help you comply with various compliance frameworks. For more information about using Security Hub CSPM to evaluate IAM resources, see AWS Identity and Access Management controls in the AWS Security Hub CSPM User Guide.

Contents

- When to perform a security audit
- Guidelines for auditing
- Review your AWS account credentials
- Review your IAM users
- Review your IAM groups
- Review your IAM roles
- Review your IAM providers for SAML and OpenID Connect (OIDC)
- Review Your mobile apps

- Tips for reviewing IAM policies

When to perform a security audit

Audit your security configuration in the following situations:

- On a periodic basis. Perform the steps described in this document at regular intervals as a best practice for security.
- If there are changes in your organization, such as people leaving.
- If you have stopped using one or more individual AWS services to verify that you have removed permissions that users in your account no longer need.
- If you've added or removed software in your accounts, such as applications on Amazon EC2 instances, OpsWorks stacks, CloudFormation templates, etc.
- If you suspect that an unauthorized person might have accessed your account.

Guidelines for auditing

As you review your account's security configuration, follow these guidelines:

- **Be thorough**. Look at all aspects of your security configuration, including those that are seldom used.
- **Don't assume**. If you are unfamiliar with some aspect of your security configuration (for example, the reasoning behind a particular policy or the existence of a role), investigate the business need until you understand the potential risk.
- **Keep things simple**. To make auditing (and management) easier, use IAM groups, IAM roles, consistent naming schemes, and straightforward policies.

Review your AWS account credentials

Take these steps when you audit your AWS account credentials:

1. If you have access keys for your root user that you're not using, you can remove them. We strongly recommend that you don't use root access keys for everyday work with AWS, and that instead you use users with temporary credentials, such users in AWS IAM Identity Center.
2. If you require access keys for your account, make sure you update them when needed.

Review your IAM users

Take these steps when you audit your existing IAM users:

1. List your users and then delete users that aren't needed.
2. Remove users from groups that they don't require access to.
3. Review the policies attached to the groups the user is in. See Tips for reviewing IAM policies.
4. Delete security credentials that the user doesn't need or that might have been exposed. For example, an IAM user used for an application doesn't need a password (which is necessary only to sign in to AWS websites). Similarly, if a user doesn't use access keys, there's no reason for the user to have one. For more information, see Managing Passwords for IAM users and Managing Access Keys for IAM users.

   You can generate and download a credential report that lists all IAM users in your account and the status of their various credentials, including passwords, access keys, and MFA devices. For passwords and access keys, the credential report shows the date and time when the password or access key was last used. Consider removing credentials that haven't been used recently from your account. (Don't remove your Emergency Access user.) For more information, see Getting Credential Reports for your AWS Account.
5. Update passwords and access keys when needed for use cases that require long-term credentials. For more information, see Managing Passwords for IAM Users and Managing Access Keys for IAM users.
6. As a best practice, require human users to use federation with an identity provider to access AWS using temporary credentials. If possible, transition from IAM users to federated principals, such as users in IAM Identity Center. Retain the minimum number of IAM users needed for your applications.

Review your IAM groups

Take these steps when you audit your IAM groups:

1. List your groups and then delete groups that you aren't using.
2. Review users in each group and remove users that don't belong.
3. Review the policies attached to the group. See Tips for reviewing IAM policies.

Review your IAM roles

Take these steps when you audit your IAM roles:

1. List your roles and then delete roles that you aren't using.
2. Review the role's trust policy. Make sure that you know who the principal is and that you understand why that account or user needs to be able to assume the role.
3. Review the access policy for the role to be sure that it grants suitable permissions to whoever assumes the role—see Tips for reviewing IAM policies.

Review your IAM providers for SAML and OpenID Connect (OIDC)

If you have created an IAM entity for establishing trust with a SAML or OIDC identity provider (IdP), take these steps:

1. Delete unused providers.
2. Download and review the AWS metadata documents for each SAML IdP and make sure the documents reflect your current business needs.
3. Get the latest metadata documents from the SAML IdPs and update the provider in IAM.

Review Your mobile apps

If you have created a mobile app that makes requests to AWS, take these steps:

1. Make sure that the mobile app doesn't contain embedded access keys, even if they're in encrypted storage.
2. Get temporary credentials for the app by using APIs designed for that purpose.

> **Note**
>
> We recommend that you use Amazon Cognito to manage user identity in your app. This service lets you authenticate users using Login with Amazon, Facebook, Google, or any OpenID Connect (OIDC)–compatible identity provider. For more information, see Amazon Cognito identity pools in the *Amazon Cognito Developer Guide*.

Tips for reviewing IAM policies

Policies are powerful and subtle, so it's important to study and understand the permissions granted by each policy. Use the following guidelines when reviewing policies:

- Attach policies to groups or roles instead of to individual users. If an individual user has a policy, make sure you understand why that user needs the policy.
- Make sure that IAM users, groups, and roles have the permissions that they need and don't have any additional permissions.
- Use the IAM Policy Simulator to test policies attached to users or groups.
- Remember that a user's permissions are the result of all applicable policies— both identity-based policies (on users, groups,or roles) and resource-based policies (on resources such as Amazon S3 buckets, Amazon SQS queues, Amazon SNS topics, and AWS KMS keys). It's important to examine all the policies that apply to a user and to understand the complete set of permissions granted to an individual user.
- Be aware that allowing a user to create an IAM user, group, role, or policy and attach a policy to the principal entity is effectively granting that user all permissions to all resources in your account. Users who can create policies and attach them to a user, group, or role can grant themselves any permissions. In general, don't grant IAM permissions to users or roles whom you don't trust with full access to the resources in your account. When conducting your security audit confirm that the following IAM permissions are granted to trusted identities:
  - `iam:PutGroupPolicy`
  - `iam:PutRolePolicy`
  - `iam:PutUserPolicy`
  - `iam:CreatePolicy`
  - `iam:CreatePolicyVersion`
  - `iam:AttachGroupPolicy`
  - `iam:AttachRolePolicy`
  - `iam:AttachUserPolicy`
- Make sure policies don't grant permissions for services that you don't use. For example, if you use AWS managed policies, make sure the AWS managed policies that are in use in your account are for services that you actually use. To find out which AWS managed policies are in use in your account, use the IAM `GetAccountAuthorizationDetails` API (AWS CLI command: `aws iam get-account-authorization-details`).

- If the policy grants a user permission to launch an Amazon EC2 instance, it might also allow the `iam:PassRole` action, but if so it should explicitly list the roles that the user can pass to the Amazon EC2 instance.
- Examine any values for the `Action` or `Resource` element that include `*`. When possible, grant `Allow` access to the individual actions and resources that users need. However, the following are reasons that it might be suitable to use `*` in a policy:
  - The policy is designed to grant administrative-level permissions.
  - The wildcard character is used for a set of similar actions (for example, `Describe*`) as a convenience, and you are comfortable with the complete list of actions that are referenced in this way.
  - The wildcard character is used to indicate a class of resources or a resource path (for example, `arn:aws:iam::account-id:users/division_abc/*`), and you are comfortable granting access to all the resources in that class or path.
  - A service action doesn't support resource-level permissions, and the only choice for a resource is `*`.
- Examine policy names to make sure they reflect the policy's function. For example, although a policy might have a name that includes "read only," the policy might actually grant write or change permissions.

For more information about planning for your security audit, see Best Practices for Security, Identity, and Compliance in the *AWS Architecture Center*.

Data protection in AWS Identity and Access Management

The AWS applies to data protection in AWS Identity and Access Management. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.

- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with IAM or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data encryption in IAM and AWS STS

Data encryption typically falls into two categories: encryption at rest and encryption in transit.

Encryption at rest

Data that is collected and stored by IAM is encrypted at rest.

- **IAM** – Data collected and stored within IAM includes IP addresses, customer account metadata, and customer identifying data that includes passwords. Customer account metadata and customer identifying data are encrypted at rest using AES 256 or is hashed using SHA 256.
- **AWS STS** – AWS STS does not collect customer content except for service logs that log successful, erroneous, and faulty requests to the service.

Encryption in transit

Customer identifying data, including passwords, is encrypted in transit using TLS 1.2 and 1.3. All AWS STS endpoints support HTTPS for encrypting data in transit. For a list of AWS STS endpoints, see AWS STS Regions and endpoints.

Key management in IAM and AWS STS

You can't manage encryption keys using IAM or AWS STS. For more information about encryption keys, see What is AWS KMS? in the AWS Key Management Service Developer Guide

Internetwork traffic privacy in IAM and AWS STS

Requests to IAM must be made using Transport Layer Security protocol (TLS). You can secure connections to the AWS STS service by using VPC endpoints. To learn more, see Interface VPC endpoints.

Logging and monitoring in AWS Identity and Access Management

Monitoring is an important part of maintaining the reliability, availability, and performance of AWS Identity and Access Management (IAM), AWS Security Token Service (AWS STS) and your other AWS solutions. AWS provides several tools for monitoring your AWS resources and responding to potential incidents:

- *AWS CloudTrail* captures all API calls for IAM and AWS STS as events, including calls from the console and API calls. To learn more about using CloudTrail with IAM and AWS STS, see Logging IAM and AWS STS API calls with AWS CloudTrail. For more information about CloudTrail, see the AWS CloudTrail User Guide.
- *AWS Identity and Access Management and Access Analyzer* helps you identify the resources in your organization and accounts, such as Amazon S3 buckets or IAM roles, that are shared with an external entity. This helps you identify unintended access to your resources and data, which is a security risk. To learn more, see What is IAM Access Analyzer?
- *Amazon CloudWatch* monitors your AWS resources and the applications that you run on AWS in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the Amazon CloudWatch User Guide.
- *Amazon CloudWatch Logs* helps you monitor, store, and access your log files from Amazon EC2 instances, CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the Amazon CloudWatch Logs User Guide.

For additional resources and security best practices for IAM, see Security best practices and use cases in AWS Identity and Access Management.

Logging IAM and AWS STS API calls with AWS CloudTrail

IAM and AWS STS are integrated with AWS CloudTrail, a service that provides a record of actions taken by an IAM user or role. CloudTrail captures all API calls for IAM and AWS STS as events, including calls from the console and from API calls. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. You can use CloudTrail to get information about the request that was made to IAM or AWS STS. For example, you can view the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

Topics

- IAM and AWS STS information in CloudTrail
- Logging IAM and AWS STS API requests
- Logging API requests to other AWS services
- Logging user sign-in events
- Logging sign-in events for temporary credentials
- Example IAM API events in CloudTrail log
- Example AWS STS API events in CloudTrail log

- IAM role trust policy behavior

IAM and AWS STS information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in IAM or AWS STS, that activity is recorded in a CloudTrail event along with other AWS service events

in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for IAM and AWS STS, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All IAM and AWS STS actions are logged by CloudTrail and are documented in the IAM API Reference and the AWS Security Token Service API Reference.

Logging IAM and AWS STS API requests

CloudTrail logs all authenticated API requests to IAM and AWS STS API operations. CloudTrail also logs non-authenticated requests to the AWS STS actions, `AssumeRoleWithSAML` and `AssumeRoleWithWebIdentity`, and logs information provided by the identity provider. However, some non-authenticated AWS STS requests might not be logged because they do not meet the minimum expectation of being sufficiently valid to be trusted as a legitimate request. For cross-account role assumption requests, CloudTrail does not log denied AWS STS requests in the target account's CloudTrail.

You can use the logged information to map calls made by an OIDC or SAML federated principal with an assumed role back to the originating external federated caller. In the case of `AssumeRole`, you can map calls back to the originating AWS service or to the account of the originating user. The `userIdentity` section of the JSON data in the CloudTrail log entry contains the information that you need to map the AssumeRole* request with a specific session principal. For more information, see CloudTrail userIdentity Element in the *AWS CloudTrail User Guide*.

AWS CloudTrail logs will contain MFA information when the IAM user sign in with MFA. If the IAM user assumes an IAM role, CloudTrail will also log `mfaAuthenticated: true` in the

`sessionContext` attributes for actions performed using the assumed role. However, CloudTrail logging is separate from what IAM requires when API calls are made with the assumed role's credentials. For more information, see CloudTrail userIdentity Element.

For example, calls to the IAM `CreateUser`, `DeleteRole`, `ListGroups`, and other API operations are all logged by CloudTrail.

Examples for this type of log entry are presented later in this topic.

Logging API requests to other AWS services

Authenticated requests to other AWS service API operations are logged by CloudTrail, and these log entries contain information about who generated the request.

For example, assume that you made a request to list Amazon EC2 instances or create an AWS CodeDeploy deployment group. Details about the person or service that made the request are contained in the log entry for that request. This information helps you determine whether the request was made by the AWS account root user, an IAM user, a role, or another AWS service.

For more details about the user identity information in CloudTrail log entries, see userIdentity Element in the *AWS CloudTrail User Guide*.

Logging user sign-in events

CloudTrail logs sign-in events to the AWS Management Console, local development tools like AWS CLI and SDKs, the AWS discussion forums, and AWS Marketplace. CloudTrail logs successful and failed sign-in attempts for IAM users, SAML and OIDC federated principals, and AWS STS federated user principals.

To view sample CloudTrail events for successful and unsuccessful root user sign-ins, see Example event records for root users in the *AWS CloudTrail User Guide*.

As a security best practice, AWS does not log the entered IAM user name text when the sign-in failure is caused by *an incorrect user name*. The user name text is masked by the value `HIDDEN_DUE_TO_SECURITY_REASONS`. For an example of this, see Example sign-in failure event caused by incorrect user name, later in this topic. The user name text is obscured because such failures might be caused by user errors. Logging these errors could expose potentially sensitive information. For example:

- You accidentally type your password in the user name box.

- You choose the link for the sign-in page of one AWS account, but then type the account number for a different AWS account.
- You forget which account you are signing in to and accidentally type the account name of your personal email account, your bank sign-in identifier, or some other private ID.

Logging sign-in events for temporary credentials

When a principal requests temporary credentials, the principal type determines how CloudTrail logs the event. This can be complicated when a principal assumes a role in another account. There are multiple API calls to perform operations related to role cross-account operations. First, the principal calls an AWS STS API to retrieve the temporary credentials. That operation is logged in the calling account and the account where the AWS STS operation is performed. Then the principal then uses the role to perform other API calls in the assumed role's account.

You can use the `sts:SourceIdentity` condition key in the role trust policy to require users to specify an identity when they assume a role. For example, you can require that IAM users specify their own user name as their source identity. This can help you determine which user performed a specific action in AWS. For more information, see `sts:SourceIdentity`. You can also use `sts:RoleSessionName` to require users to specify a session name when they assume a role. This can help you differentiate between role sessions for a role that is used by different principals when you review AWS CloudTrail logs.

The following table shows how CloudTrail logs different user identity information for each of the AWS STS APIs that generate temporary credentials.

Principal type	STS API	User identity in CloudTrail log for caller's account	User identity in CloudTrail log for the assumed role's account	User identity in CloudTrail log for the role's subsequent API calls
AWS account root user credentials	GetSessionToken	Root user identity	Role owner account is same as calling account	Root user identity

Principal type	STS API	User identity in CloudTrail log for caller's account	User identity in CloudTrail log for the assumed role's account	User identity in CloudTrail log for the role's subsequent API calls
AWS account root user credentials	AssumeRoot	Root user session	Account number and principal ID (if a user)	Root user session
IAM user	GetSessionToken	IAM user identity	Role owner account is same as calling account	IAM user identity
IAM user	GetFederationToken	IAM user identity	Role owner account is same as calling account	IAM user identity
IAM user	AssumeRole	IAM user identity	Account number and principal ID (if a user), or AWS service principal	Role identity only (no user)
Externally authenticated user	AssumeRoleWithSAML	n/a	SAML user identity	Role identity only (no user)
Externally authenticated user	AssumeRoleWithWebIdentity	n/a	OIDC/Web user identity	Role identity only (no user)

CloudTrail considers an action read-only if it does not have any mutating effect on a resource. When logging a read-only event, CloudTrail redacts the `responseElements` information in the log. When CloudTrail logs an event that is not read-only, the full `responseElements`

is shown in the log entry. For the AWS STS APIs `AssumeRole`, `AssumeRoleWithSAML`, and `AssumeRoleWithWebIdentity`, even though they are logged as read-only, CloudTrail will include the full `responseElements` except `secretAccessKey` in the log for these APIs.

The following table shows how CloudTrail logs `responseElements` and `readOnly` information for each of the AWS STS APIs that generate temporary credentials.

STS API	Response elements information	Read-only
AssumeRole	Included	true
AssumeRoleWithSAML	Included	true
AssumeRoleWithWebIdentity	Included	true
AssumeRoot	Included	false
GetFederationToken	Included	false
GetSessionToken	Included	false

Example IAM API events in CloudTrail log

CloudTrail log files contain events that are formatted using JSON. An API event represents a single API request and includes information about the principal, the requested action, any parameters, and the date and time of the action.

Example IAM API event in CloudTrail log file

The following example shows a CloudTrail log entry for a request made for the IAM `GetUserPolicy` action.

```
{
    "eventVersion": "1.09",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE:Role-Session-Name",
        "arn": "arn:aws:sts::111122223333:assumed-role/Role-Name/Role-Session-Name",
        "accountId": "111122223333",
```

```
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AIDACKCEVSQ6C2EXAMPLE",
                "arn": "arn:aws:iam::111122223333:role/Admin",
                "accountId": "111122223333",
                "userName": "Admin"
            },
            "attributes": {
                "creationDate": "2024-09-09T17:50:16Z",
                "mfaAuthenticated": "false"
            }
        }
    },
    "eventTime": "2024-09-09T17:51:44Z",
    "eventSource": "iam.amazonaws.eu",
    "eventName": "GetUserPolicy",
    "awsRegion": "us-east-1",
    "sourceIPAddress": "192.0.2.101",
    "userAgent": "aws-cli/1.16.96 Python/2.7.8 Linux/10 botocore/1.12.86",
    "requestParameters": {
        "userName": "ExampleIAMUserName",
        "policyName": "ExamplePoliccyName"
    },
    "responseElements": null,
    "requestID": "9EXAMPLE-0c68-11e4-a24e-d5e16EXAMPLE",
    "eventID": "cEXAMPLE-127e-4632-980d-505a4EXAMPLE",
    "readOnly": true,
    "eventType": "AwsApiCall",
    "managementEvent": true,
    "recipientAccountId": "111122223333",
    "eventCategory": "Management",
    "tlsDetails": {
        "tlsVersion": "TLSv1.3",
        "cipherSuite": "TLS_AES_128_GCM_SHA256",
        "clientProvidedHostHeader": "iam.amazonaws.com"
    }
}
```

From this event information, you can determine that the request was made to get a user policy named `ReadOnlyAccess-JaneDoe-201407151307` for user `JaneDoe`, as specified in the `requestParameters` element. You can also see that the request was made by an IAM user

named JaneDoe on July 15, 2014 at 9:40 PM (UTC). In this case, the request originated in the AWS Management Console, as you can tell from the userAgent element.

Example AWS STS API events in CloudTrail log

CloudTrail log files contain events that are formatted using JSON. An API event represents a single API request and includes information about the principal, the requested action, any parameters, and the date and time of the action.

Example cross-account AWS STS API events in CloudTrail log files

The IAM user named John in account 777788889999 calls the AWS STS AssumeRole action to assume the role EC2-dev in account 111122223333. The account administrator requires users to set a source identity equal to their user name when assuming the role. The user passes in the source identity value of John.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIDAQRSTUVWXYZEXAMPLE",
    "arn": "arn:aws:iam::777788889999:user/John",
    "accountId": "777788889999",
    "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "userName": "John"
  },
  "eventTime": "2014-07-18T15:07:39Z",
  "eventSource": "sts.amazonaws.eu",
  "eventName": "AssumeRole",
  "awsRegion": "us-east-2",
  "sourceIPAddress": "192.0.2.101",
  "userAgent": "aws-cli/1.11.10 Python/2.7.8
 Linux/3.2.45-0.6.wd.865.49.315.metal1.x86_64 botocore/1.4.67",
  "requestParameters": {
    "roleArn": "arn:aws:iam::111122223333:role/EC2-dev",
    "roleSessionName": "John-EC2-dev",
    "sourceIdentity": "John",
  },
  "responseElements": {
    "credentials": {
      "sessionToken": "<encoded session token blob>",
      "accessKeyId": "ASIAI44QH8DHBEXAMPLE",
```

```
      "expiration": "Jul 18, 2023, 4:07:39 PM"
      },
    "assumedRoleUser": {
      "assumedRoleId": "AIDAQRSTUVWXYZEXAMPLE:John-EC2-dev",
      "arn": "arn:aws:sts::111122223333:assumed-role/EC2-dev/John-EC2-dev"
    },
  "sourceIdentity": "John"
  },
  "resources": [
    {
      "ARN": "arn:aws:iam::111122223333:role/EC2-dev",
      "accountId": "111122223333",
      "type": "AWS::IAM::Role"
    }
  ],
  "requestID": "4EXAMPLE-0e8d-11e4-96e4-e55c0EXAMPLE",
  "sharedEventID": "bEXAMPLE-efea-4a70-b951-19a88EXAMPLE",
  "eventID": "dEXAMPLE-ac7f-466c-a608-4ac8dEXAMPLE",
  "eventType": "AwsApiCall",
  "recipientAccountId": "111122223333"
}
```

The second example shows the assumed role account's (111122223333) CloudTrail log entry for the same request.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "AWSAccount",
    "principalId": "AIDAQRSTUVWXYZEXAMPLE",
    "accountId": "777788889999"
  },

  "sourceIPAddress": "192.0.2.101",
  "userAgent": "aws-cli/1.11.10 Python/2.7.8
 Linux/3.2.45-0.6.wd.865.49.315.metal1.x86_64 botocore/1.4.67",
  "requestParameters": {
    "roleArn": "arn:aws:iam::111122223333:role/EC2-dev",
    "roleSessionName": "John-EC2-dev",
    "sourceIdentity": "John",
```

```
  },
  "responseElements": {
    "credentials": {
      "sessionToken": "<encoded session token blob>",
      "accessKeyId": "ASIAI44QH8DHBEXAMPLE",
      "expiration": "Jul 18, 2014, 4:07:39 PM"
    },
    "assumedRoleUser": {
      "assumedRoleId": "AIDAQRSTUVWXYZEXAMPLE:John-EC2-dev",
      "arn": "arn:aws:sts::111122223333:assumed-role/EC2-dev/John-EC2-dev"
      },
  "sourceIdentity": "John"
  },
  "requestID": "4EXAMPLE-0e8d-11e4-96e4-e55c0EXAMPLE",
  "sharedEventID": "bEXAMPLE-efea-4a70-b951-19a88EXAMPLE",
  "eventID": "dEXAMPLE-ac7f-466c-a608-4ac8dEXAMPLE"
}
```

Example AWS STS role chaining API event in CloudTrail log file

The following example shows a CloudTrail log entry for a request made by John Doe in account 111111111111. John previously used his `John` user to assume the `JohnRole1` role. For this request, he uses the credentials from that role to assume the `JohnRole2` role. This is known as role chaining. The source identity that he set when he assumed the `John1` role persists in the request to assume `JohnRole2`. If John tries to set a different source identity when assuming the role, the request is denied. John passes two session tags into the request. He sets those two tags as transitive. The request inherits the `Department` tag as transitive because John set it as transitive when he assumed `JohnRole1`. For more information about source identity, see Monitor and control actions taken with assumed roles. For more information about transitive keys in role chains, see Chaining roles with session tags.

```
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AROAIN5ATK5U7KEXAMPLE:JohnRole1",
        "arn": "arn:aws:sts::111111111111:assumed-role/John/JohnRole1",
        "accountId": "111111111111",
        "accessKeyId": "ASIAIOSFODNN7EXAMPLE",

Example AWS service AWS STS API event in CloudTrail log file

The following example shows a CloudTrail log entry for a request made by an AWS service calling another service API using permissions from a service role. It shows the CloudTrail log entry for the request made in account 777788889999.

```
{
  "eventVersion": "1.04",
  "userIdentity": {
    "type": "AssumedRole",
```

```
    "principalId": "AROAQRSTUVWXYZEXAMPLE:devdsk",
    "arn": "arn:aws:sts::777788889999:assumed-role/AssumeNothing/devdsk",
    "accountId": "777788889999",
    "accessKeyId": "ASIAI44QH8DHBEXAMPLE",
    "sessionContext": {
      "attributes": {
        "creationDate": "2016-11-14T17:25:26Z"
      },
      "sessionIssuer": {
        "type": "Role",
        "principalId": "AROAQRSTUVWXYZEXAMPLE",
        "arn": "arn:aws:iam::777788889999:role/AssumeNothing",
        "accountId": "777788889999",
        "userName": "AssumeNothing"
      }
    }
  },
  "eventTime": "2016-11-14T17:25:45Z",
  "eventSource": "s3.amazonaws.com",
  "eventName": "DeleteBucket",
  "awsRegion": "us-east-2",
  "sourceIPAddress": "192.0.2.1",
  "userAgent": "[aws-cli/1.11.10 Python/2.7.8

  "requestParameters": {
    "bucketName": "amzn-s3-demo-bucket"
  },
  "responseElements": null,
  "requestID": "EXAMPLE463D56D4C",
  "eventID": "dEXAMPLE-265a-41e0-9352-4401bEXAMPLE",
  "eventType": "AwsApiCall",
  "recipientAccountId": "777788889999"
}
```

Example SAML AWS STS API event in CloudTrail log file

The following example shows a CloudTrail log entry for a request made for the AWS STS AssumeRoleWithSAML action. The request includes the SAML attributes `CostCenter` and `Project` that are passed through the SAML assertion as session tags. Those tags are set as transitive so that they persist in role chaining scenarios. The request includes the optional API parameter `DurationSeconds`, represented as `durationSeconds` in the CloudTrail log, and is set to `1800` seconds. The request also includes the SAML attribute `sourceIdentity`, which is passed

in the SAML assertion. If someone uses the resulting role session credentials to assume another role, this source identity persists.

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "SAMLUser",
        "principalId": "SampleUkh1i4+ExamplexL/jEvs=:SamlExample",
        "userName": "SamlExample",
        "identityProvider": "bdGOnTesti4+ExamplexL/jEvs="
    },
    "eventTime": "2023-08-28T18:30:58Z",
    "eventSource": "sts.amazonaws.com",
    "eventName": "AssumeRoleWithSAML",

        "clientProvidedHostHeader": "sts.us-east-2.amazonaws.com"
    }
}
```

Example OIDC AWS STS API event in CloudTrail log file

The following example shows a CloudTrail log entry for a request made for the AWS STS AssumeRoleWithWebIdentity action. The request includes the attributes `CostCenter` and `Project` that are passed through the OpenID Connect (OIDC) identity provider (IdP) token as

session tags. Those tags are set as transitive so that they persist in role chaining. The request includes the `sourceIdentity` attribute from the identity provider token. If someone uses the resulting role session credentials to assume another role, this source identity persists.

The CloudTrail log entry also contains an `additionalEventData` field with an `identityProviderConnectionVerificationMethod` attribute. This attribute indicates the method AWS used to verify the connection with the OIDC provider. The attribute value will be either `IAMTrustStore` or `Thumbprint`. The `IAMTrustStore` value indicates that AWS successfully verified the connection with the OIDC IdP using our library of trusted root certificate authorities (CAs). The `Thumbprint` value indicates that AWS used a certificate thumbprint set in the IdP configuration to verify the OIDC IdP server certificate.

```

Example AWS STS API event using the global endpoint in CloudTrail log file

For requests to the AWS Security Token Service (AWS STS) global endpoint (`https://sts.amazonaws.com`), AWS STS includes additional AWS CloudTrail log fields: `endpointType` and `awsServingRegion`. These fields appear under the `addtionalEventData` `RequestDetails` element to log the serving AWS Region and endpoint type being called. The `endpointType` field can have a value of `global` or `regional` to indicate the type of global endpoint that served the request. For more information about the AWS STS global endpoint changes, see AWS STS Regions and endpoints.

> **Note**
>
> AWS CloudTrail logs for requests made to the AWS STS global endpoint will be sent to the US East (N. Virginia) Region. CloudTrail logs for requests served by AWS STS Regional endpoints will continue to be logged to their respective Region in CloudTrail.

The following example shows a CloudTrail log entry for an AWS STS request made to the global endpoint (`https://sts.amazonaws.com`) that originated from the Europe (Stockholm) Region - eu-north-1. The `endpointType` field value of `global` indicates that the AWS STS request was served by the global endpoint in the Europe (Stockholm) Region.

```

        "roleSessionName": "test-global-assume-role"
    },
    "responseElements": {
        "credentials": {
            "accessKeyId": "ASIAIOSFODNN7EXAMPLE",
            "sessionToken": "<encoded session token blob>",
            "expiration": "Feb 12, 2025, 11:16:48 PM"
        },
        "assumedRoleUser": {
            "assumedRoleId": "AROA987654321EXAMPLE:test-global-assume-role",
            "arn": "arn:aws:sts::777788889999:assumed-role/test-role/test-global-
assume-role"
        }
    },
    "additionalEventData": {
        "RequestDetails": {
            "awsServingRegion": "eu-north-1",
            "endpointType": "global"
        }
    },
    "requestID": "EXAMPLE7-2497-457a-9586-f21feEXAMPLE",
    "eventID": "EXAMPLEc-3d26-4c3a-9c94-722a9EXAMPLE",
    "readOnly": true,
    "resources": [
        {
            "accountId": "777788889999",
            "type": "AWS::IAM::Role",
            "ARN": "arn:aws:iam::777788889999:role/test-role"
        }
    ],
    "eventType": "AwsApiCall",
```

```
    "managementEvent": true,
    "recipientAccountId": "777788889999",
    "eventCategory": "Management",
    "tlsDetails": {
        "tlsVersion": "TLSv1.3",
        "cipherSuite": "TLS_AES_128_GCM_SHA256",
        "clientProvidedHostHeader": "sts-global.eu-north-1.amazonaws.com"
    }
}
```

For comparison, the following example shows a CloudTrail log entry for an AWS STS request made to the Regional endpoint (`https://sts.us-west-2.amazonaws.com`) that was served by the Regional endpoint in the Europe (Stockholm) Region - eu-north-1. The `endpointType` field value of `regional` indicates that the AWS STS request was served by the global endpoint in the Europe (Stockholm) Region.

Example sign-in events in CloudTrail log

CloudTrail log files contain events that are formatted using JSON. A sign-in event represents a single sign-in request and includes information about the sign-in principal, the Region, and the date and time of the action.

Example sign-in success event in CloudTrail log file

The following example shows a CloudTrail log entry for a successful sign-in event.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIDACKCEVSQ6C2EXAMPLE",
    "arn":"arn:aws:iam::111122223333:user/John",
    "accountId": "111122223333",
    "userName": "John"
  },
  "eventTime": "2014-07-16T15:49:27Z",
  "eventSource": "signin.amazonaws.eu",
  "eventName": "ConsoleLogin",
  "awsRegion": "us-east-2",
  "sourceIPAddress": "192.0.2.110",
  "userAgent": "Mozilla/5.0 (Windows NT 6.1; WOW64; rv:24.0) Gecko/20100101
 Firefox/24.0",
  "requestParameters": null,
  "responseElements": {
    "ConsoleLogin": "Success"
  },
  "additionalEventData": {
    "MobileVersion": "No",
    "LoginTo": "https://eusc-de-east-1.console.amazonaws-eusc.eu/s3/__"
  },
  "eventID": "3fcfb182-98f8-4744-bd45-10a395ab61cb"
}
```

The following example shows a CloudTrail log entry for a successful authorization code request.

```
{
```

```
"eventVersion": "1.11",
"userIdentity": {
"type": "AssumedRole",
"principalId": "AROATJHQDX737YZP72NTF:thesjain-Isengard",

"readOnly": true,
"eventType": "AwsApiCall",
"managementEvent": true,
"recipientAccountId": "225989345271",
"eventCategory": "Management",
"tlsDetails": {
"tlsVersion": "TLSv1.3",
"cipherSuite": "TLS_AES_128_GCM_SHA256",
"clientProvidedHostHeader": "us-east-1.signin.aws.amazon.com"
}
}
```

For more details about the information contained in CloudTrail log files, see CloudTrail Event Reference in the *AWS CloudTrail User Guide*.

Example sign-in failure event in CloudTrail log file

The following example shows a CloudTrail log entry for a failed sign-in event.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIDACKCEVSQ6C2EXAMPLE",
    "arn":"arn:aws:iam::111122223333:user/JaneDoe",
    "accountId": "111122223333",
    "userName": "JaneDoe"
  },
  "eventTime": "2014-07-08T17:35:27Z",
  "eventSource": "signin.amazonaws.eu",
  "eventName": "ConsoleLogin",
  "awsRegion": "us-east-2",
```

```
  "sourceIPAddress": "192.0.2.100",
  "userAgent": "Mozilla/5.0 (Windows NT 6.1; WOW64; rv:24.0) Gecko/20100101
 Firefox/24.0",
  "errorMessage": "Failed authentication",
  "requestParameters": null,
  "responseElements": {
    "ConsoleLogin": "Failure"
  },
  "additionalEventData": {
    "MobileVersion": "No",
    "LoginTo": "https://console.www.aws.eu/sns"
  },
  "eventID": "11ea990b-4678-4bcd-8fbe-62509088b7cf"
}
```

From this information, you can determine that the sign-in attempt was made by an IAM user named `JaneDoe`, as shown in the `userIdentity` element. You can also see that the sign-in attempt failed, as shown in the `responseElements` element. You can see that `JaneDoe` tried to sign in to the Amazon SNS console at 5:35 PM (UTC) on July 8, 2014.

Example sign-in failure event caused by incorrect user name

The following example shows a CloudTrail log entry for an unsuccessful sign-in event caused by the user entering an incorrect user name. AWS masks the `userName` text with `HIDDEN_DUE_TO_SECURITY_REASONS` to help prevent exposing potentially sensitive information.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "accountId": "123456789012",
    "accessKeyId": "",
    "userName": "HIDDEN_DUE_TO_SECURITY_REASONS"
  },
  "eventTime": "2015-03-31T22:20:42Z",
  "eventSource": "signin.amazonaws.eu",
  "eventName": "ConsoleLogin",
  "awsRegion": "us-east-2",
  "sourceIPAddress": "192.0.2.101",
  "userAgent": "Mozilla/5.0 (Windows NT 6.1; WOW64; rv:24.0) Gecko/20100101
 Firefox/24.0",
  "errorMessage": "No username found in supplied account",
```

```
  "requestParameters": null,
  "responseElements": {
    "ConsoleLogin": "Failure"
  },
  "additionalEventData": {
    "LoginTo": "https://eusc-de-east-1.console.amazonaws-eusc.eu/console/home?
state=hashArgs%23&isauthcode=true",
    "MobileVersion": "No"
  },
  "eventID": "a7654656-0417-45c6-9386-ea8231385051",
  "eventType": "AwsConsoleSignin",
  "recipientAccountId": "123456789012"
}
```

IAM role trust policy behavior

On September 21st, 2022, AWS made changes to IAM role trust policy behavior to require explicit allows in a role trust policy when a role assumes itself. IAM roles in the legacy behavior allow list have an additionalEventData field present for explicitTrustGrant for `AssumeRole` events. The value of `explicitTrustGrant` is false when a role on the legacy allow list assumes itself using the legacy behavior. When a role on the legacy allow list assumes itself but the role trust policy behavior has been updated to explicitly allow the role to assume itself, the value of `explicitTrustGrant` is true.

Only a very small number of IAM roles are on the allow list for the legacy behavior, and this field is only present in CloudTrail logs for these roles when they assume themselves. In most cases, it is not necessary for an IAM role to assume itself. AWS recommends updating your processes, code, or configurations to remove this behavior or updating your role trust policies to explicitly allow for this behavior. For more information, see Announcing an update to IAM role trust policy behavior.

Track privileged tasks in AWS CloudTrail

The AWS Organizations management account or a delegated administrator account for IAM can perform some root user tasks on member accounts using short-term root access. Short-term privileged sessions give you temporary credentials that you can scope to take privileged actions on a member account in your organization. You can use the following steps to identify the actions taken by the management account or a delegated administrator during the `sts:AssumeRoot` session.

Note

The global endpoint is not supported for `sts:AssumeRoot`. CloudTrail records `ConsoleLogin` events in the Region specified for the endpoint.

To track actions performed by a privileged session in CloudTrail logs

1. Find the `AssumeRoot` event in your CloudTrail logs. This event is generated when your management account or the delegated administrator for IAM gets a set of short term credentials from `sts:AssumeRoot`.

   In the following example, the CloudTrail event for AssumeRoot is logged in the `eventName` field.

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE:JohnRole1",
        "arn": "arn:aws:sts::111111111111:assumed-role/John/JohnRole1",
        "accountId": "111111111111",
        "accessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AIDACKCEVSQ6C2EXAMPLE",
                "arn": "arn:aws:iam::111111111111:role/John",
                "accountId": "111111111111",
                "userName": "Admin2"
            },
            "webIdFederationData": {},
            "attributes": {
                "creationDate": "2024-10-25T20:45:28Z",
                "mfaAuthenticated": "false"
            },
            "assumedRoot": "true"
        }
    },
    "eventTime": "2024-10-25T20:52:11Z",
    "eventSource": "sts.amazonaws.com",
    "eventName": "AssumeRoot",
```

```
    "awsRegion": "us-west-2",
    "sourceIPAddress": "192.0.2.1",
    "requestParameters": {
        "targetPrincipal": "222222222222",
        "taskPolicyArn": {
            "arn": "arn:aws:iam::aws:policy/root-task/S3UnlockBucketPolicy"
        }
    },
    "responseElements": {
        "credentials": {
            "accessKeyId": "ASIAIOSFODNN7EXAMPLE",
            "sessionToken": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
            "expiration": "Oct 25, 2024, 9:07:11 PM"
        }
    }
}
```

For steps to access your CloudTrail logs, see Getting and viewing your CloudTrail log files in the *AWS CloudTrail User Guide*.

2. In the CloudTrail event log, locate the `targetPrincipal` that specifies the member account actions were taken on, and the `accessKeyId` that is unique to the `AssumeRoot` session.

   In the following example, the `targetPrincipal` is 222222222222 and the `accessKeyId` is ASIAIOSFODNN7EXAMPLE.

```
"eventTime": "2024-10-25T20:52:11Z",
    "eventSource": "sts.amazonaws.com",
    "eventName": "AssumeRoot",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "192.0.2.1",
    "requestParameters": {
        "targetPrincipal": "222222222222",
        "taskPolicyArn": {
            "arn": "arn:aws:iam::aws:policy/root-task/S3UnlockBucketPolicy"
        }
    },
    "responseElements": {
        "credentials": {
            "accessKeyId": "ASIAIOSFODNN7EXAMPLE",
            "sessionToken": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
            "expiration": "Oct 25, 2024, 9:07:11 PM"
    }
```

```
}
```

3. In the CloudTrail logs for the target principal, search for the access key ID that corresponds to the `accessKeyId` value from the `AssumeRoot` event. Use the `eventName` field values to determine the privileged tasks performed during the `AssumeRoot` session. There may be multiple privileged tasks performed in a single session. The maximum session duration for `AssumeRoot` is 900 seconds (15 minutes).

   In the following example, the management account or delegated administrator deleted the resource-based policy for an Amazon S3 bucket.

```
{
    "eventVersion": "1.10",
    "userIdentity": {
        "type": "Root",
        "principalId": "222222222222",
        "arn": "arn:aws:iam::222222222222:root",
        "accountId": "222222222222",
        "accessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "attributes": {
                "creationDate": "2024-10-25T20:52:11Z",
                "mfaAuthenticated": "false"
            }
        }
    },
    "eventTime": "2024-10-25T20:53:47Z",
    "eventSource": "s3.amazonaws.com",
    "eventName": "DeleteBucketPolicy",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "192.0.2.1",
    "requestParameters": {
        "bucketName": "resource-policy-John",
        "Host": "resource-policy-John.s3.amazonaws.com",
        "policy": ""
    },
    "responseElements": null,
    "requestID": "1234567890abcdef0",
    "eventID": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "readOnly": false,
    "resources": [
        {
            "accountId": "222222222222",
```

```
            "type": "AWS::S3::Bucket",
            "ARN": "arn:aws:s3:::resource-policy-John"
        }
    ],
    "eventType": "AwsApiCall",
    "managementEvent": true,
    "recipientAccountId": "222222222222",
    "eventCategory": "Management",
    "tlsDetails": {
        "tlsVersion": "TLSv1.3",
        "cipherSuite": "TLS_AES_128_GCM_SHA256",
        "clientProvidedHostHeader": "resource-policy-John.s3.amazonaws.com"
    }
}
```

Compliance validation for AWS Identity and Access Management

Third-party auditors assess the security and compliance of AWS Identity and Access Management (IAM) as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, ISO, and others.

To learn whether an AWS service is within the scope of specific compliance programs, see and choose the compliance program that you are interested in. For general information, see .

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Resilience in AWS Identity and Access Management

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions have multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

AWS Identity and Access Management (IAM) and AWS Security Token Service (AWS STS) are self-sustaining, Region-based services that are available globally.

IAM is a critical AWS service. Every operation performed in AWS must be authenticated and authorized by IAM. IAM checks each request against the identities and policies stored in IAM to determine if the request is allowed or denied. IAM was designed with a separate *control plane* and *data plane* so that the service authenticates even during unexpected failures. IAM resources that are used in authorizations, such as roles and policies, are stored in the control plane. IAM customers can change the configuration of these resources by using IAM operations such as `DeletePolicy` and `AttachRolePolicy`. Those configuration change requests go to the control plane. There is one IAM control plane for all commercial AWS Regions, which is located in the US East (N. Virginia) Region. The IAM system then propagates configuration changes to the IAM data planes in every enabled AWS Region. The IAM data plane is essentially a read-only replica of the IAM control plane configuration data. Each AWS Region has a completely independent instance of the IAM data plane, which performs authentication and authorization for requests from the same Region. In each Region, the IAM data plane is distributed across at least three Availability Zones, and has sufficient capacity to tolerate the loss of an Availability Zone without any customer impairment. Both the IAM control and data planes were built for *zero planned downtime*, with all software updates and scaling operations performed in a manner that is invisible to customers.

In Regions that are enabled by default, requests to the AWS STS global endpoint are automatically served in the same Region where the request originates. In opt-in Regions, requests to the AWS STS global endpoint are served by a single AWS Region, US East (N. Virginia). You can use a Regional AWS STS endpoint to reduce latency or provide additional redundancy for your applications. To learn more, see Manage AWS STS in an AWS Region.

Certain events can interrupt communication between AWS Regions over the network. However, even when you can't communicate with the global IAM endpoint, AWS STS can still authenticate IAM principals and IAM can authorize your requests. The specific details of an event that interrupts communication will determine your ability to access AWS services. In most situations, you can continue to use IAM credentials in your AWS environment. The following conditions might apply to an event that interrupts communication.

Access keys for IAM users

You can authenticate indefinitely in a Region with long-term access keys for IAM users. When you use the AWS Command Line Interface and APIs, you can provide AWS access keys so that AWS can verify your identity in programmatic requests.

> **Important**
>
> As a best practice, we recommend that your users sign in with temporary credentials instead of long-term access keys.

Temporary credentials

You can request new temporary credentials with the AWS STS Regional service endpoint for at least 24 hours. The following API operations generate temporary credentials.

- **AssumeRole**
- **AssumeRoleWithWebIdentity**
- **AssumeRoleWithSAML**
- **GetFederationToken**
- **GetSessionToken**

Principals and permissions

- You might not be able to add, modify, or remove principals or permissions in IAM.
- Your credentials might not reflect changes to your permissions that you recently applied in IAM. For more information, see Changes that I make are not always immediately visible.

AWS Management Console

- You might be able to use a Regional sign-in endpoint to sign in to the AWS Management Console as an IAM user. Regional sign-in endpoints have the following URL format.

  `https://{Account ID}.signin.aws.amazon.com/console?region={Region}`

  Example: https://111122223333.signin.aws.amazon.com/console?region=us-west-2
- You might not be able to complete Universal 2nd Factor (U2F) multi-factor authentication (MFA).

Best practices for IAM resilience

AWS has built resilience into AWS Regions and Availability Zones. When you observe the following IAM best practices in the systems that interact with your environment, you take advantage of that resilience.

1. Use an AWS STS Regional service endpoint instead of the default global endpoint.

2. Review the configuration of your environment for vital resources that routinely create or modify IAM resources, and prepare a fallback solution that uses existing IAM resources.

Infrastructure security in AWS Identity and Access Management

As a managed service, AWS Identity and Access Management is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access IAM through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

IAM can be accessed programmatically by using the IAM HTTPS API, which lets you issue HTTPS requests directly to the service. The Query API returns sensitive information, including security credentials. Therefore, you must use HTTPS with all API requests. When you use the HTTPS API, you must include code to digitally sign requests using your credentials.

You can call these API operations from any network location, but IAM does support resource-based access policies, which can include restrictions based on the source IP address. You can also use IAM policies to control access from specific Amazon Virtual Private Cloud (Amazon VPC) endpoints or specific VPCs. Effectively, this isolates network access to a given IAM resource from only the specific VPC within the AWS network.

Configuration and vulnerability analysis in AWS Identity and Access Management

AWS handles basic security tasks like guest operating system (OS) and database patching, firewall configuration, and disaster recovery. These procedures have been reviewed and certified by the appropriate third parties. For more details, see the following resources:

- Shared Responsibility Model

- Amazon Web Services: Overview of Security Processes (whitepaper)

The following resources also address configuration and vulnerability analysis in AWS Identity and Access Management (IAM):

- Compliance validation for AWS Identity and Access Management
- Security best practices and use cases in AWS Identity and Access Management

AWS managed policies for AWS Identity and Access Management and Access Analyzer

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that AWS managed policies might not grant least-privilege permissions for your specific use cases because they're available for all AWS customers to use. We recommend that you reduce permissions further by defining customer managed policies that are specific to your use cases.

You cannot change the permissions defined in AWS managed policies. If AWS updates the permissions defined in an AWS managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. AWS is most likely to update an AWS managed policy when a new AWS service is launched or new API operations become available for existing services.

For more information, see AWS managed policies in the *IAM User Guide*.

IAMReadOnlyAccess

Use the `IAMReadOnlyAccess` managed policy to allow read only access to IAM resources. This policy grants permission to get and list all IAM resources. It allows viewing details and activity reports for users, groups, roles, policies, identity providers, and MFA devices. It does not include the

ability to create or delete resources or access to IAM Access Analyzer resources. View the policy for the full list of services and actions supported by this policy.

IAMUserChangePassword

Use the `IAMUserChangePassword` managed policy to allow IAM users to change their password.

You configure your IAM **Account settings** and the **Password policy** to allow IAM users to change their IAM account password. When you allow this action, IAM attaches the policy to each user.

To view the JSON policy, see IAMUserChangePassword in the AWS Managed Policy Reference Guide.

IAMAccessAnalyzerFullAccess

Use the `IAMAccessAnalyzerFullAccess` AWS managed policy to allow your administrators to access IAM Access Analyzer.

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **IAM Access Analyzer** – Allows full administrative permissions to all resources in IAM Access Analyzer.
- **Create service linked role** – Allows the administrator to create a service-linked role, which allows IAM Access Analyzer to analyze resources in other services on your behalf. This permission allows creating the service-linked role only for use by IAM Access Analyzer.
- **AWS Organizations** – Allows administrators to use IAM Access Analyzer for an organization in AWS Organizations. After enabling trusted access for IAM Access Analyzer in AWS Organizations, members of the management account can view findings across their organization.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
```

```
        "access-analyzer:*"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": "iam:CreateServiceLinkedRole",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "iam:AWSServiceName": "access-analyzer.amazonaws.com"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "organizations:DescribeAccount",
        "organizations:DescribeOrganization",
        "organizations:DescribeOrganizationalUnit",
        "organizations:ListAccounts",
        "organizations:ListAccountsForParent",
        "organizations:ListAWSServiceAccessForOrganization",
        "organizations:ListChildren",
        "organizations:ListDelegatedAdministrators",
        "organizations:ListOrganizationalUnitsForParent",
        "organizations:ListParents",
        "organizations:ListRoots"
      ],
      "Resource": "*"
    }
  ]
}
```

IAMAccessAnalyzerReadOnlyAccess

Use the `IAMAccessAnalyzerReadOnlyAccess` AWS managed policy to allow read-only access to IAM Access Analyzer.

To also allow read-only access to IAM Access Analyzer for AWS Organizations, create a customer managed policy that allows the Describe and List actions from the IAMAccessAnalyzerFullAccess AWS managed policy.

Service-level permissions

This policy provides read-only access to IAM Access Analyzer. No other service permissions are included in this policy.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Sid": "IAMAccessAnalyzerReadOnlyAccess",
      "Effect": "Allow",
      "Action": [
        "access-analyzer:CheckAccessNotGranted",
        "access-analyzer:CheckNoNewAccess",
        "access-analyzer:Get*",
        "access-analyzer:List*",
        "access-analyzer:ValidatePolicy"
      ],
      "Resource": "*"
    }
  ]
}
```

AccessAnalyzerServiceRolePolicy

You can't attach AccessAnalyzerServiceRolePolicy to your IAM entities. This policy is attached to a service-linked role that allows IAM Access Analyzer to perform actions on your behalf. For more information, see Using service-linked roles for AWS Identity and Access Management and Access Analyzer.

Permissions groupings

This policy allows access to IAM Access Analyzer to analyze resource metadata from multiple AWS services.

- **Amazon DynamoDB** – Allows permissions to view DynamoDB streams and tables.
- **Amazon Elastic Compute Cloud** – Allows permissions to describe IP addresses, snapshots, and VPCs.

- **Amazon Elastic Container Registry** – Allows permissions to describe image repositories, retrieve account settings, and retrieve registry and repository policies.
- **Amazon Elastic File System** – Allows permissions to view the description of an Amazon EFS file system and view the resource-level policy for an Amazon EFS file system.
- **AWS Identity and Access Management** – Allows permissions to retrieve information about a specified role and list the IAM roles that have a specified path prefix. Allows permissions to retrieve information about users, IAM groups, login profiles, access keys, and service last accessed data.
- **AWS Key Management Service** – Allows permissions to view detailed information about an KMS key and its key policies and grants.
- **AWS Lambda** – Allows permissions to view information about Lambda aliases, functions, layers, and aliases.
- **AWS Organizations** – Allows permissions to AWS Organizations and allows the creation of an analyzer within the AWS organization as the zone of trust.
- **Amazon Relational Database Service** – Allows permissions to view detailed information about Amazon RDS DB snapshots and Amazon RDS DB cluster snapshots.
- **Amazon Simple Storage Service** – Allows permissions to view detailed information about Amazon S3 access points, buckets, Amazon S3 directory bucket access points, and directory buckets.
- **AWS Secrets Manager** – Allows permissions to view detailed information about secrets and resource policies attached to secrets.
- **Amazon Simple Notification Service** – Allows permissions to view detailed information about a topic.
- **Amazon Simple Queue Service** – Allows permissions to view detailed information about specified queues.

To view the JSON policy, see AccessAnalyzerServiceRolePolicy in the AWS Managed Policy Reference Guide.

IAMAuditRootUserCredentials

Use the `IAMAuditRootUserCredentials` AWS managed policy to scope down permissions when you perform a privileged task on an AWS Organizations member account to audit root user credential status of a member account. You can list or get individual root user credential information like:

- Whether there is a root user password
- If the root user has an access key and when it was last used
- If the root user has associated signing certificates
- The root user associated MFA devices
- List of the consolidated root user credential status

You can't attach `IAMAuditRootUserCredentials` to your IAM entities. This policy is attached to AssumeRoot to perform privileged tasks on a member account in your organization. For more information, see Centrally manage root access for member accounts.

JSON

```
{
   "Version":"2012-10-17",
   "Statement": [
      {
         "Sid": "DenyAllOtherActionsOnAnyResource",
         "NotAction": [
            "iam:ListAccessKeys",
            "iam:ListSigningCertificates",
            "iam:GetLoginProfile",
            "iam:ListMFADevices",
            "iam:GetAccountSummary",
            "iam:GetUser",
            "iam:GetAccessKeyLastUsed"
         ],
         "Effect": "Deny",
         "Resource": "*"
      },
      {
         "Sid": "DenyAuditingCredentialsOnNonRootUserResource",
         "Action": [
            "iam:ListAccessKeys",
            "iam:ListSigningCertificates",
            "iam:GetLoginProfile",
            "iam:ListMFADevices" ,
            "iam:GetUser",
            "iam:GetAccessKeyLastUsed"
         ],
         "Effect": "Deny",
```

```
            "NotResource": "arn:aws:iam::*:root"
        }
    ]
}
```

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **DenyAllOtherActionsOnAnyResource** – Denies access to credentials for all resources.
- **DenyAuditingCredentialsOnNonRootUserResource** – Denies access to credentials for all non-root user resources.

IAMCreateRootUserPassword

Use the `IAMCreateRootUserPassword` AWS managed policy to scope down permissions when you perform a privileged task on an AWS Organizations member account to allow password recovery for a member account with no root user credentials.

You can't attach `IAMCreateRootUserPassword` to your IAM entities. This policy is attached to AssumeRoot to perform privileged tasks on a member account in your organization. For more information, see Centrally manage root access for member accounts.

JSON

```
{
   "Version":"2012-10-17",
   "Statement": [
      {
         "Sid": "DenyAllOtherActionsOnAnyResource",
         "NotAction": [
            "iam:CreateLoginProfile",
            "iam:GetLoginProfile"
         ],
         "Effect": "Deny",
         "Resource": "*"
      },
      {
         "Sid": "DenyCreatingPasswordOnNonRootUserResource",
```

```
            "Action": [
               "iam:CreateLoginProfile",
               "iam:GetLoginProfile"
            ],
            "Effect": "Deny",
            "NotResource": "arn:aws:iam::*:root"
         }
      ]
}
```

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **DenyAllOtherActionsOnAnyResource** – Denies access to get or create a password for all resources.
- **DenyCreatingPasswordOnNonRootUserResource** – Denies access to get or create a password for all non-root user resources.

IAMDeleteRootUserCredentials

Use the `IAMDeleteRootUserCredentials` AWS managed policy to scope down permissions when you perform a privileged task on an AWS Organizations member account to remove root user credentials including password, access keys, signing certificates, and deactivating MFA. Additional permissions are required for this privileged action, so you can view last used credential information, verify last used information for the member account root user, and list permissions for all root user credentials to be deleted.

You can't attach `IAMDeleteRootUserCredentials` to your IAM entities. This policy is attached to AssumeRoot to perform privileged tasks on a member account in your organization. For more information, see Centrally manage root access for member accounts.

JSON

```

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **DenyAllOtherActionsOnAnyResource** – Denies access to get or delete credentials for all resources.
- **DenyDeletingRootUserCredentialsOnNonRootUserResource** – Denies access to get or delete credentials for all non-root user resources.

S3UnlockBucketPolicy

Use the `S3UnlockBucketPolicy` AWS managed policy to scope down permissions when you perform a privileged task on an AWS Organizations member account to remove a misconfigured bucket policy that denies all principals from accessing an Amazon S3 bucket.

You can't attach `S3UnlockBucketPolicy` to your IAM entities. This policy is attached to AssumeRoot to perform privileged tasks on a member account in your organization. For more information, see Centrally manage root access for member accounts.

```

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **DenyAllOtherActionsOnAnyResource** – Denies access to bucket policies for all resources.
- **DenyManagingBucketPolicyForNonRootCallers** – Denies access to bucket policies for all non-root user resources.

SQSUnlockQueuePolicy

Use the `SQSUnlockQueuePolicy` AWS managed policy to scope down permissions when you perform a privileged task on an AWS Organizations member account to delete an Amazon Simple Queue Service resource-based policy that denies all principals from accessing an Amazon SQS queue.

You can't attach `SQSUnlockQueuePolicy` to your IAM entities. This policy is attached to AssumeRoot to perform privileged tasks on a member account in your organization. For more information, see Centrally manage root access for member accounts.

Permissions groupings

This policy is grouped into statements based on the set of permissions provided.

- **DenyAllOtherActionsOnAnyResource** – Denies access to Amazon SQS actions for all resources.
- **DenyGettingQueueAttributesOnNonOwnQueue** – Denies access to Amazon SQS queue attributes for queues owned by another account.
- **DenyActionsForNonRootUser** – Denies access to Amazon SQS actions for all non-root user resources.

IAM and IAM Access Analyzer updates to AWS managed policies

View details about updates to IAM and AWS managed policies since the service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the IAM and IAM Access Analyzer Document history pages.

Change	Description	Date
IAMUserChangePassword – Added permissions	IAM added permissions to `IAMUserChangePassword` to allow users specified within a path.	May 28, 2025
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added `iam:GetAccountAuthorizationDetails` to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	May 12, 2025
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for Amazon S3 directory bucket access points to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	March 31, 2025
IAMDeleteRootUserCredentials – Removed permissions	IAM removed the `iam:DeleteVirtualMFADevice` permission from the managed policy.	January 7, 2025
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for permission to	December 10, 2024

Change	Description	Date
	retrieve information about Amazon ECR account settings and registry policies to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	
IAMAuditRootUserCredentials – Added managed policy	IAM added managed policies for Centrally manage root access for member accounts to scope privileged tasks you can perform on AWS Organizations member accounts.	November 14, 2024
IAMCreateRootUserPassword – Added managed policy	IAM added managed policies for Centrally manage root access for member accounts to scope privileged tasks you can perform on AWS Organizations member accounts.	November 14, 2024
IAMDeleteRootUserCredentials – Added managed policy	IAM added managed policies for Centrally manage root access for member accounts to scope privileged tasks you can perform on AWS Organizations member accounts.	November 14, 2024

Change	Description	Date
S3UnlockBucketPolicy – Added managed policy	IAM added managed policies for Centrally manage root access for member accounts to scope privileged tasks you can perform on AWS Organizations member accounts.	November 14, 2024
SQSUnlockQueuePolicy – Added managed policy	IAM added managed policies for Centrally manage root access for member accounts to scope privileged tasks you can perform on AWS Organizations member accounts.	November 14, 2024
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for permission to retrieve information about IAM user and role tags to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	October 29, 2024
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for permission to retrieve information about IAM user and role policies to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	May 30, 2024

Change	Description	Date
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for permission to retrieve the current state of the block public access for Amazon EC2 snapshots to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	January 23, 2024
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for DynamoDB streams and tables to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	January 11, 2024
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for Amazon S3 directory buckets to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	December 1, 2023
IAMAccessAnalyzerReadOnlyAccess – Added permissions	IAM Access Analyzer added permissions to allow you to check whether updates to your policies grant additional access. This permission is required by IAM Access Analyzer to perform policy checks on your policies.	November 26, 2023

Change	Description	Date
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added IAM actions to the service-level permissions of `AccessAnalyzerServiceRolePolicy` to support the following actions: • Listing entities for a policy • Generating service last accessed details • Listing access key information	November 26, 2023
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added support for the following resource types to the service-level permissions of `AccessAnalyzerServiceRolePolicy` : • Amazon EBS volume snapshots • Amazon ECR repositories • Amazon EFS file systems • Amazon RDS DB snapshots • Amazon RDS DB cluster snapshots • Amazon SNS topics	October 25, 2022

Change	Description	Date
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added the `lambda:GetFunctionUrlConfig` action to the service-level permissions of `AccessAnalyzerServiceRolePolicy` .	April 6, 2022
AccessAnalyzerServiceRolePolicy – Added permissions	IAM Access Analyzer added new Amazon S3 actions to analyze metadata associated with multi-region access points.	September 2, 2021
IAMAccessAnalyzerReadOnlyAccess – Added permissions	IAM Access Analyzer added a new action to grant `ValidatePolicy` permissions to allow you to use the policy checks for validation. This permission is required by IAM Access Analyzer to perform policy checks on your policies.	March 16, 2021
IAM Access Analyzer started tracking changes	IAM Access Analyzer started tracking changes for its AWS managed policies.	March 1, 2021

Security features outside IAM

You use IAM to control access to tasks that are performed using the AWS Management Console, the AWS Command Line Tools, or service API operations using the AWS SDKs. Some AWS products have other ways to secure their resources as well. The following list provides some examples, though it is not exhaustive.

Amazon EC2

In Amazon Elastic Compute Cloud you log into an instance with a key pair (for Linux instances) or using a user name and password (for Microsoft Windows instances).

For more information, see the following documentation:

- Getting Started with Amazon EC2 Linux Instances in the *Amazon EC2 User Guide*
- Getting Started with Amazon EC2 Windows Instances in the *Amazon EC2 User Guide*

Amazon RDS

In Amazon Relational Database Service you log into the database engine with a user name and password that are tied to that database.

For more information, see Getting Started with Amazon RDS in the *Amazon RDS User Guide*.

Amazon EC2 and Amazon RDS

In Amazon EC2 and Amazon RDS you use security groups to control traffic to an instance or database.

For more information, see the following documentation:

- Amazon EC2 Security Groups for Linux Instances in the *Amazon EC2 User Guide*
- Amazon EC2 Security Groups for Windows Instances in the *Amazon EC2 User Guide*
- Amazon RDS Security Groups in the *Amazon RDS User Guide*

WorkSpaces

In Amazon WorkSpaces, users sign in to a desktop with a user name and password.

For more information, see Getting Started with WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

These access control methods are not part of IAM. IAM lets you control how these AWS products are administered—creating or terminating an Amazon EC2 instance, setting up new WorkSpaces desktops, and so on. That is, IAM helps you control the tasks that are performed by making requests to Amazon Web Services, and it helps you control access to the AWS Management Console. However, IAM does not help you manage security for tasks like signing in to an operating system (Amazon EC2), database (Amazon RDS), or desktop (Amazon WorkSpaces).

When you work with a specific AWS product, be sure to read the documentation to learn the security options for all the resources that belong to that product.

Using AWS Identity and Access Management Access Analyzer

AWS Identity and Access Management Access Analyzer provides the following capabilities:

- IAM Access Analyzer external access analyzers help identify resources in your organization and accounts that are shared with an external entity.
- IAM Access Analyzer internal access analyzers help identify internal access to selected resources in your organization and accounts.
- IAM Access Analyzer unused access analyzers help identify unused access in your organization and accounts.
- IAM Access Analyzer validates IAM policies against policy grammar and AWS best practices.
- IAM Access Analyzer custom policy checks help validate IAM policies against your specified security standards.
- IAM Access Analyzer generates IAM policies based on access activity in your AWS CloudTrail logs.

Identifying resources shared with an external entity

IAM Access Analyzer helps you identify the resources in your organization and accounts, such as Amazon S3 buckets or IAM roles, shared with an external entity. This lets you identify unintended access to your resources and data, which is a security risk. IAM Access Analyzer identifies resources shared with external principals by using logic-based reasoning to analyze the resource-based policies in your AWS environment. For each instance of a resource shared outside of your account, IAM Access Analyzer generates a finding. Findings include information about the access and the external principal granted to it. You can review findings to determine if the access is intended and safe or if the access is unintended and a security risk. In addition to helping you identify resources shared with an external entity, you can use IAM Access Analyzer findings to preview how your policy affects public and cross-account access to your resource before deploying resource permissions. The findings are organized in a visual summary dashboard. The dashboard highlights the split between public and cross-account access findings, and provides a breakdown of findings by resource type. To learn more about the dashboard, see View the IAM Access Analyzer findings dashboard.

> **Note**
>
> An external entity can be another AWS account, a root user, an IAM user or role, a federated user, an anonymous user, or another entity that you can use to create a filter. For more information, see AWS JSON Policy Elements: Principal.

When you enable IAM Access Analyzer, you create an analyzer for your entire organization or your account. The organization or account you choose is known as the zone of trust for the analyzer. The analyzer monitors all of the supported resources within your zone of trust. Any access to resources by principals within your zone of trust is considered trusted. Once enabled, IAM Access Analyzer analyzes the policies applied to all of the supported resources in your zone of trust. After the first analysis, IAM Access Analyzer analyzes these policies periodically. If you add a new policy or change an existing policy, IAM Access Analyzer analyzes the new or updated policy within about 30 minutes.

When analyzing the policies, if IAM Access Analyzer identifies one that grants access to an external principal that isn't within your zone of trust, it generates a finding. Each finding includes details about the resource, the external entity with access to it, and the permissions granted so that you can take appropriate action. You can view the details included in the finding to determine whether the resource access is intentional or a potential risk that you should resolve. When you add a policy to a resource, or update an existing policy, IAM Access Analyzer analyzes the policy. IAM Access Analyzer also analyzes all resource-based policies periodically.

On rare occasions under certain conditions, IAM Access Analyzer does not receive notification of an added or updated policy, which can cause delays in generated findings. IAM Access Analyzer can take up to 6 hours to generate or resolve findings if you create or delete a multi-region access point associated with an Amazon S3 bucket, or update the policy for the multi-region access point. Also, if there is a delivery issue with AWS CloudTrail log delivery or resource control policy (RCP) restriction changes, the policy change does not trigger a rescan of the resource reported in the finding. When this happens, IAM Access Analyzer analyzes the new or updated policy during the next periodic scan, which is within 24 hours. If you want to confirm a change you make to a policy resolves an access issue reported in a finding, you can rescan the resource reported in a finding by using the **Rescan** link in the **Findings** details page, or by using the `StartResourceScan` operation of the IAM Access Analyzer API. To learn more, see Resolve IAM Access Analyzer findings.

Important

For external access, IAM Access Analyzer analyzes only policies applied to resources in the same AWS Region where it's enabled. To monitor all resources in your AWS environment, you must create an external access analyzer to enable IAM Access Analyzer in each Region where you're using supported AWS resources.
For unused access, findings for the analyzer do not change based on Region. Creating an unused access analyzer in each Region where you have resources is not required.

IAM Access Analyzer analyzes the following resource types for external access:

- Amazon Simple Storage Service buckets
- Amazon Simple Storage Service directory buckets
- AWS Identity and Access Management roles
- AWS Key Management Service keys
- AWS Lambda functions and layers
- Amazon Simple Queue Service queues
- AWS Secrets Manager secrets
- Amazon Simple Notification Service topics
- Amazon Elastic Block Store volume snapshots
- Amazon Relational Database Service DB snapshots
- Amazon Relational Database Service DB cluster snapshots
- Amazon Elastic Container Registry repositories
- Amazon Elastic File System file systems
- Amazon DynamoDB streams
- Amazon DynamoDB tables

Identifying internal access to business-critical resources

For your selected business-critical resources, IAM Access Analyzer helps you identify which principals within your organization or account have access to them. This analysis supports implementing the principle of least privilege by ensuring that your specified resources can only be accessed by the intended principals within your organization.

Internal access analysis helps you:

- Determine which IAM users or roles within your account or organization can access your specified resources
- Understand access paths between principals and resources within your AWS environment
- Verify that your access controls are working as intended
- Review findings to determine if the access is intended and safe or if the access is unintended and presents a security risk
- Identify and remediate unintended access within your organization

IAM Access Analyzer analyzes the following resource types for internal access:

- Amazon Simple Storage Service buckets
- Amazon Simple Storage Service directory buckets
- Amazon Relational Database Service DB snapshots
- Amazon Relational Database Service DB cluster snapshots
- Amazon DynamoDB streams
- Amazon DynamoDB tables

Identifying unused access granted to IAM users and roles

IAM Access Analyzer helps you identify and review unused access in your AWS organization and accounts. IAM Access Analyzer continuously monitors all IAM roles and users in your AWS organization and accounts and generates findings for unused access. The findings highlight unused roles, unused access keys for IAM users, and unused passwords for IAM users. For active IAM roles and users, the findings provide visibility into unused services and actions.

IAM Access Analyzer reviews last accessed information for all roles in your AWS organization and accounts to help you identify unused access. IAM action last accessed information helps you identify unused actions for roles in your AWS accounts. For more information, see Refine permissions in AWS using last accessed information.

The findings for external, internal, and unused access analyzers are organized into a visual summary dashboard. The dashboard highlights your AWS resources and AWS accounts that have the most findings and provides a breakdown of findings by type. For more information about the dashboard, see View the IAM Access Analyzer findings dashboard.

Validating policies against AWS best practices

You can validate your policies against IAM policy grammar and AWS best practices using the basic policy checks provided by IAM Access Analyzer policy validation. You can create or edit a policy using the AWS CLI, AWS API, or JSON policy editor in the IAM console. You can view policy validation check findings that include security warnings, errors, general warnings, and suggestions for your policy. These findings provide actionable recommendations that help you author policies that are functional and conform to AWS best practices. To learn more about validating policies using policy validation, see Validate policies with IAM Access Analyzer.

Validating policies against your specified security standards

You can validate your policies against your specified security standards using the IAM Access Analyzer custom policy checks. You can create or edit a policy using the AWS CLI, AWS API, or JSON policy editor in the IAM console. Through the console, you can check whether your updated policy grants new access compared to the existing version. Through AWS CLI and AWS API, you can also check specific IAM actions that you consider critical are not allowed by a policy. These checks highlight a policy statement that grants new access. You can update the policy statement and re-run the checks until the policy conform to your security standard. To learn more about validating policies using custom policy checks, see Validate policies with IAM Access Analyzer custom policy checks.

Generating policies

IAM Access Analyzer analyzes your AWS CloudTrail logs to identify actions and services that have been used by an IAM entity (user or role) within your specified date range. It then generates an IAM policy that is based on that access activity. You can use the generated policy to refine an entity's permissions by attaching it to an IAM user or role. To learn more about generating policies using IAM Access Analyzer, see IAM Access Analyzer policy generation.

Pricing for IAM Access Analyzer

IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per analyzer per month.

- You will be charged for each unused access analyzer that you create.

- Creating unused access analyzers across multiple Regions will result in you being charged for each analyzer.
- Service-linked roles aren't analyzed for unused access activity and they aren't included in the total number of IAM roles analyzed.

IAM Access Analyzer charges for internal access analysis based on the number of resources monitored per internal access analyzer per month.

IAM Access Analyzer charges for custom policy checks based on the number of API requests made to IAM Access Analyzer to check for new access.

For a complete list of charges and prices for IAM Access Analyzer, see IAM Access Analyzer pricing.

To see your bill, go to the **Billing and Cost Management Dashboard** in the AWS Billing and Cost Management console. Your bill contains links to usage reports that provide details about your bill. To learn more about AWS account billing, see the AWS Billing User Guide

If you have questions concerning AWS billing, accounts, and events, contact Support.

IAM Access Analyzer findings

IAM Access Analyzer generates findings for external access, internal access, and unused access in your AWS account or organization.

For external access, IAM Access Analyzer generates a finding for each instance of a resource-based policy that grants access to a resource within your zone of trust to a principal that is not within your zone of trust. When you create an external access analyzer, you choose an organization or AWS account to analyze. Any principal in the organization or account that you choose for the analyzer is considered trusted. Because principals in the same organization or account are trusted, the resources and principals within the organization or account comprise the zone of trust for the analyzer. Any sharing that is within the zone of trust is considered safe, so IAM Access Analyzer does not generate a finding. For example, if you select an organization as the zone of trust for an analyzer, all resources and principals in the organization are within the zone of trust. If you grant permissions to an Amazon S3 bucket in one of your organization member accounts to a principal in another organization member account, IAM Access Analyzer does not generate a finding. But if you grant permission to a principal in an account that is not a member of the organization, IAM Access Analyzer generates a finding.

For internal access, IAM Access Analyzer generates findings when there is a possible access path between an IAM role or user within your organization and your specified resources. Similar to external access analysis, the scope you choose (organization or account) determines what is considered internal. If you select an organization as the scope, IAM Access Analyzer will generate findings for access paths between principals and resources within your organization. If you select an account, findings will be generated for access paths within that specific account. IAM Access Analyzer uses automated reasoning to evaluate all IAM policies to monitor who has access to your resources.

The combination of external and internal access findings with the same zone of trust provides a comprehensive analysis of all possible access to a particular resource, both from within and outside your defined trust boundary.

For unused access, IAM Access Analyzer generates findings for unused access granted in your AWS organization and accounts. When you create an unused access analyzer, IAM Access Analyzer continuously monitors all IAM roles and users in your AWS organization and accounts and generates findings for unused access. IAM Access Analyzer generates the following types of findings for unused access:

- **Unused roles** – Roles with no access activity within the specified usage window.
- **Unused IAM user access keys and passwords** – Credentials belonging to IAM users that have not been used to access your AWS account in the specified usage window.
- **Unused permissions** – Service-level and action-level permissions that weren't used by a role within the specified usage window. IAM Access Analyzer uses identity-based policies attached to roles to determine the services and actions that those roles can access. IAM Access Analyzer supports review of unused permissions for all service-level permissions. For a complete list of action-level permissions that are supported for unused access findings, see IAM action last accessed information services and actions.

> **Note**
>
> IAM Access Analyzer offers external access findings for free. There are charges for unused access findings based on the number of IAM roles and users analyzed per analyzer per month. There are also charges for internal access findings based on the number of AWS resources monitored per analyzer per month. For more details about pricing, see IAM Access Analyzer pricing.

Understand how IAM Access Analyzer findings work

This topic describes the concepts and terms that are used in IAM Access Analyzer to help you become familiar with how IAM Access Analyzer monitors access to your AWS resources.

External access findings

External access findings are generated only once for each instance of a resource that is shared outside of your zone of trust. Each time a resource-based policy is modified, IAM Access Analyzer analyzes the policy. If the updated policy shares a resource that is already identified in a finding, but with different permissions or conditions, a new finding is generated for that instance of the resource sharing. Changes to a resource control policy that impact the **Resource control policy (RCP) restriction** also generate a new finding. IAM Access Analyzer also evaluates access control configurations established by declarative policies. If the access in the first finding is removed, that finding is updated to a status of **Resolved**.

The status of all findings remains **Active** until you archive them or remove the access that generated the finding. When you remove the access, the finding status is updated to **Resolved**.

> **Note**
>
> It may take up to 30 minutes after a policy is modified for IAM Access Analyzer to analyze the resource and then update the external access finding. Changes to a resource control policy (RCP) do not trigger a rescan of the resource reported in the finding. IAM Access Analyzer analyzes the new or updated policy during the next periodic scan, which is within 24 hours.

How IAM Access Analyzer generates findings for external access

AWS Identity and Access Management Access Analyzer uses a technology called Zelkova to analyze IAM policies and identify external access to resources.

Zelkova translates IAM policies into equivalent logical statements and runs them through a suite of general-purpose and specialized logical solvers (satisfiability modulo theories). IAM Access Analyzer applies Zelkova repeatedly to a policy, using increasingly specific queries to characterize the types of access the policy allows based on its content. For more information about satisfiability modulo theories, see Satisfiability Modulo Theories.

For external access analyzers, IAM Access Analyzer does not examine access logs to determine whether an external entity has actually accessed a resource within your zone of trust. Instead, it generates a finding when a resource-based policy allows access to a resource, regardless of whether the resource was accessed by the external entity.

Additionally, IAM Access Analyzer does not consider the state of any external accounts when making its determinations. If it indicates that account 111122223333 can access your Amazon S3 bucket, it doesn't have any information about the users, roles, service control policies (SCP), or other relevant configurations in that account. This is for customer privacy, as IAM Access Analyzer doesn't know who owns the other account. This is also for security, as it's important to know about potential external access even if there are currently no active principals that can use it.

IAM Access Analyzer only considers certain IAM condition keys that external users can't directly influence or that are otherwise impactful to authorization. For examples of condition keys IAM Access Analyzer considers, see IAM Access Analyzer filter keys.

IAM Access Analyzer doesn't currently report findings from AWS service principals or internal service accounts. In rare cases where it can't fully determine whether a policy statement grants access to an external entity, it errs on the side of declaring a false positive finding. This is because IAM Access Analyzer is designed to provide a comprehensive view of the resource sharing in your account and to minimize false negatives.

Internal access findings

To use internal access analysis, you must first configure the analyzer by selecting the specific resources you want to monitor. Once configured, internal access findings are generated when a principal (IAM user or role) within your organization or account has access to your selected resources. A new finding is generated the next time the analyzer scans the specified resources and identifies a principal that has access to the resources. If an updated policy allows a principal that is already identified in a finding, but with different permissions or conditions, a new finding is generated for that instance of the principal and resource. This updated policy could be a resource-based policy, identity-based policy, service control policy (SCP), or resource control policy (RCP). IAM Access Analyzer also evaluates access control configurations established by declarative policies.

> **Note**
>
> Internal access findings are only available using the ListFindingsV2 API action.

How IAM Access Analyzer generates findings for internal access

To analyze internal access, you must create a separate analyzer for internal access findings for your resources, even if you've already created an analyzer to generate external access findings or unused access findings.

After creating the internal access analyzer, IAM Access Analyzer evaluates all resource-based policies, identity-based policies, service control policies (SCPs), resource control policies (RCPs), and permissions boundaries within your specified account or organization.

By creating an analyzer dedicated to internal access to your selected resources, you can identify:

- When a principal in your organization or account can access your selected resources
- The total effective permissions allowed for a principal based on the intersection of all applicable policies

- Complex access paths where a principal gains access based on the combination of identity policies and resource policies

> **Note**
>
> IAM Access Analyzer cannot generate internal access findings for organizations that contain more than 70,000 principals (IAM users and roles combined).

Unused access findings

Unused access findings are generated for IAM entities (principals) within the selected account or organization based on the number of days specified while creating the analyzer. A new finding is generated the next time the analyzer scans the entities if one of the following conditions is met:

- A role is inactive for the specified number of days.
- An unused permission, unused user password, or unused user access key surpasses the specified number of days.

> **Note**
>
> Unused access findings are only available using the ListFindingsV2 API action.

How IAM Access Analyzer generates findings for unused access

To analyze unused access, you must create a separate analyzer for unused access findings for your roles, even if you've already created an analyzer to generate external or internal access findings for your resources.

After creating the unused access analyzer, IAM Access Analyzer reviews access activity to identify unused access. IAM Access Analyzer examines the last accessed information for all IAM users, IAM roles including service roles, user access keys, and user passwords across your AWS organization and accounts. This helps you identify unused access.

> **Note**
>
> A service-linked role is a special type of service role that is linked to an AWS service and owned by the service. Service-linked roles are not analyzed by unused access analyzers.

For active IAM roles and users, IAM Access Analyzer uses last accessed information for IAM services and actions to identify unused permissions. This allows you to scale your review process at the AWS organization and account level. You can also use the action last accessed information for deeper investigation of individual roles. This provides more granular insights into which specific permissions are not being utilized.

By creating an analyzer dedicated to unused access, you can comprehensively review and identify unused access across your AWS environment, complementing the findings generated by your existing external access analyzer.

Getting started with AWS Identity and Access Management Access Analyzer

Use the information in this topic to learn about the requirements necessary to use and manage AWS Identity and Access Management Access Analyzer.

Permissions required to use IAM Access Analyzer

To successfully configure and use IAM Access Analyzer, the account you use must be granted the required permissions.

AWS managed policies for IAM Access Analyzer

AWS Identity and Access Management Access Analyzer provides AWS managed policies to help you get started quickly.

- IAMAccessAnalyzerFullAccess - Allows full access to IAM Access Analyzer for administrators. This policy also allows creating the service-linked roles that are required to allow IAM Access Analyzer to analyze resources in your account or AWS organization.
- IAMAccessAnalyzerReadOnlyAccess - Allows read-only access to IAM Access Analyzer. You must add additional policies to your IAM identities (users, groups of users, or roles) to allow them to view their findings.

Resources defined by IAM Access Analyzer

To view the resources defined by IAM Access Analyzer, see Resource types defined by IAM Access Analyzer in the *Service Authorization Reference*.

Required IAM Access Analyzer service permissions

IAM Access Analyzer uses a service-linked role (SLR) named `AWSServiceRoleForAccessAnalyzer`. This SLR grants the service read-only access to analyze AWS resources with resource-based policies and analyze unused access on your behalf. The service creates the role in your account in the following scenarios:

- You create an external access analyzer with your account as the zone of trust.
- You create an unused access analyzer with your account as the selected account.
- You create an internal access analyzer with your account as the zone of trust.

For more information, see Using service-linked roles for AWS Identity and Access Management Access Analyzer.

> **Note**
>
> IAM Access Analyzer is Regional. For external and internal access, you must enable IAM Access Analyzer in each Region independently.
> For unused access, findings for the analyzer do not change based on Region. Creating an analyzer in each Region where you have resources is not required.

In some cases, after you create an analyzer in IAM Access Analyzer, the **Findings** page or dashboard loads with no findings or summary. This might be due to a delay in the console for populating your findings. You might need to manually refresh the browser or check back later to view your findings or summary. If you still don't see any findings for an external access analyzer, it's because you have no supported resources in your account that can be accessed by an external entity. If a policy that grants access to an external entity is applied to a resource, IAM Access Analyzer generates a finding.

> **Note**
>
> For external access analyzers, it may take up to 30 minutes after a policy is modified for IAM Access Analyzer to analyze the resource and then either generate a new finding or update an existing finding for the access to the resource.
> When you create an internal access analyzer, it might take several minutes or hours before findings are available. After the initial scan, IAM Access Analyzer automatically rescans all policies every 24 hours.
> For all types of access analyzers, updates for findings might not be reflected in the dashboard immediately.

Required IAM Access Analyzer permissions to view the findings dashboard

To view the IAM Access Analyzer findings dashboard, the account you use must be granted access to perform the following required actions:

- `GetAnalyzer`
- `ListAnalyzers`
- `GetFindingsStatistics`

To view all of the actions defined by IAM Access Analyzer, see Actions defined by IAM Access Analyzer in the *Service Authorization Reference*.

IAM Access Analyzer status

To view the status of your analyzers, choose **Analyzers**. Analyzers created for an organization or account can have the following status:

Status	Description
Active	For external and internal access analyzers, the analyzer is actively monitoring resources within its zone of trust. The analyzer actively generates new findings and updates existing findings.

Status	Description
	For unused access analyzers, the analyzer is actively monitoring unused access within the selected organization or AWS account in the specified tracking period. The analyzer actively generates new findings and updates existing findings.
Creating	The creation of the analyzer is still in progress. The analyzer becomes active once creation is complete.
Disabled	The analyzer is disabled due to an action taken by the AWS Organizations administrator. For example, removing the analyzer's account as the delegated administrator for IAM Access Analyzer. When the analyzer is in a disabled state, it does not generate new findings or update existing findings.
Failed	The creation of the analyzer failed due to a configuration issue. The analyzer won't generate any findings. Delete the analyzer and create a new analyzer.

Create an IAM Access Analyzer external access analyzer

To enable an external access analyzer in a Region, you must create an analyzer in that Region. You must create an external access analyzer in each Region in which you want to monitor access to your resources.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.

Create an external access analyzer with the AWS account as the zone of trust

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Resource analysis - External access**.
5. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
6. Enter a name for the analyzer.
7. Choose **Current account** as the zone of trust for the analyzer.

> **Note**
>
> If your account is not the AWS Organizations management account or delegated administrator account, you can create only one analyzer with your account as the zone of trust.

8. Optional. Add any tags that you want to apply to the analyzer.
9. Choose **Create analyzer**.

When you create an external access analyzer to enable IAM Access Analyzer, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in your account.

Create an external access analyzer with the organization as the zone of trust

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Resource analysis - External access**.
5. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
6. Enter a name for the analyzer.
7. Choose **Current organization** as the zone of trust for the analyzer.
8. Optional. Add any tags that you want to apply to the analyzer.
9. Choose **Submit**.

When you create an external access analyzer with the organization as the zone of trust, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in each account of your organization.

Manage an IAM Access Analyzer external access analyzer

To enable an external access analyzer in a Region, you must create an analyzer in that Region. You must create an external access analyzer in each Region in which you want to monitor access to your resources.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.

Update an external access analyzer

Use the following procedure to update an external access analyzer.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. In the **Analyzers** section, choose the name of the external access analyzer to manage.
4. On the **Archive rules** tab, you can create, edit, or delete archive rules for the analyzer. For more information, see Archive rules.
5. On the **Tags** tab, you can manage and create tags for the analyzer. For more information, see Tags for AWS Identity and Access Management resources.

Delete an external access analyzer

Use the following procedure to delete an external access analyzer. When you delete an analyzer, the resources are no longer monitored and no new findings are generated. All findings that were generated by the analyzer are deleted.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. In the **Analyzers** section, choose the name of the external access analyzer to delete.
4. Choose **Delete analyzer**.

5. Enter **delete** and choose **Delete** to confirm deleting the analyzer.

Create an IAM Access Analyzer internal access analyzer

To enable an internal access analyzer in a Region, you must create an analyzer in that Region. You must create an internal access analyzer in each Region in which you want to monitor access to your resources.

IAM Access Analyzer charges for internal access analysis based on the number of resources monitored per analyzer per month. For more details about pricing, see IAM Access Analyzer pricing.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.
> IAM Access Analyzer cannot generate internal access findings for organizations that contain more than 70,000 principals (IAM users and roles combined).
> You can only create one organization-level internal access analyzer in an AWS organization.

Create an internal access analyzer with the AWS account as the zone of trust

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Resource analysis - Internal access**.
5. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
6. Enter a name for the analyzer.
7. Choose **Current account** as the zone of trust for the analyzer.

   > **Note**
   >
   > If your account is not the AWS Organizations management account or delegated administrator account, you can create only one analyzer with your account as the zone of trust.

8. In the **Resources to analyze** section, add resources for the analyzer to monitor.

- To add resources by account, choose **Add > Add resources from selected accounts**.
  1. Choose **All supported resource types** or choose **Define specific resource types** and select the resource types from the **Resource type** list.

     Internal access analyzers support the following resource types:

     - Amazon Simple Storage Service buckets
     - Amazon Simple Storage Service directory buckets
     - Amazon Relational Database Service DB snapshots
     - Amazon Relational Database Service DB cluster snapshots
     - Amazon DynamoDB streams
     - Amazon DynamoDB tables
  2. Choose **Add resources**.
- To add resources by Amazon Resource Name (ARN), choose **Add resources > Add resources by pasting in resource ARN**.

  > **Note**
  >
  > ARNs must be exact matches – wildcards are not supported. For Amazon S3, only bucket ARNs are supported. Amazon S3 object ARNs and prefixes are not supported.

  1. For each resource ARN, enter the account owner ID and the resource ARN separated by a comma. Enter one account owner ID and resource ARN per line.
  2. Choose **Add resources**.
- To add resources by a CSV file, choose **Add resources > Add resources by uploading a CSV**.

  You can use AWS Resource Explorer to search for resources in your accounts and export a CSV file. Then you can upload the CSV file to configure the resources for the analyzer to monitor.

  1. Choose **Choose file** and select the CSV file from your computer.
  2. Choose **Add resources**.

9. Optional. Add any tags that you want to apply to the analyzer.
10. Choose **Create analyzer**.

When you create an internal access analyzer to enable IAM Access Analyzer, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in your account.

Create an internal access analyzer with the organization as the zone of trust

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Resource analysis - Internal access**.
5. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
6. Enter a name for the analyzer.
7. Choose **Entire organization** as the zone of trust for the analyzer.
8. In the **Resources to analyze** section, add resources for the analyzer to monitor.

   - To add resources for the account, choose **Add resources > Add resources from selected accounts**.

     1. Choose **All supported resource types** or choose **Define specific resource types** and select the resource types from the **Resource type** list.

        Internal access analyzers support the following resource types:

        - Amazon Simple Storage Service buckets
        - Amazon Simple Storage Service directory buckets
        - Amazon Relational Database Service DB snapshots
        - Amazon Relational Database Service DB cluster snapshots
        - Amazon DynamoDB streams
        - Amazon DynamoDB tables

     2. To select accounts from your organization, choose **Select from organization**. In the **Select accounts** section, choose **Hierarchy** to select accounts by organizational structure or **List** to select accounts from a list of all accounts in your organization.

        To manually enter accounts from your organization, choose **Enter AWS account ID**. Enter one or more AWS account IDs separated by commas in the **AWS account ID** field.

     3. Choose **Add resources**.

- To add resources by Amazon Resource Name (ARN), choose **Add resources > Add resources by pasting in resource ARN**.

  > **Note**
  >
  > ARNs must be exact matches – wildcards are not supported. For Amazon S3, only bucket ARNs are supported. Amazon S3 object ARNs and prefixes are not supported.

  1. For each resource ARN, enter the account owner ID and the resource ARN separated by a comma. Enter one account owner ID and resource ARN per line.
  2. Choose **Add resources**.
- To add resources by a CSV file, choose **Add resources > Add resources by uploading a CSV**.

  You can use AWS Resource Explorer to search for resources in your accounts and export a CSV file. Then you can upload the CSV file to configure the resources for the analyzer to monitor.

  1. Choose **Choose file** and select the CSV file from your computer.
  2. Choose **Add resources**.

9. Optional. Add any tags that you want to apply to the analyzer.
10. Choose **Submit**.

When you create an internal access analyzer with the organization as the zone of trust, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in each account of your organization.

Manage an IAM Access Analyzer internal access analyzer

To enable an internal access analyzer in a Region, you must create an analyzer in that Region. You must create an internal access analyzer in each Region in which you want to monitor access to your resources.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.

Update an internal access analyzer

Use the following procedure to update an internal access analyzer.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. In the **Analyzers** section, choose the name of the internal access analyzer to manage.
4. On the **Archive rules** tab, you can create, edit, or delete archive rules for the analyzer. For more information, see Archive rules.
5. On the **Tags** tab, you can manage and create tags for the analyzer. For more information, see Tags for AWS Identity and Access Management resources.
6. On the **Resources** tab, choose **Edit** in the **Resources to analyze** section.
   a. To add resources by account, choose **Add resources > Add resources from selected accounts**.
      1. Choose **All supported resource types** or choose **Define specific resource types** and select the resource types from the **Resource type** list.

         Internal access analyzers support the following resource types:

         - Amazon Simple Storage Service buckets
         - Amazon Simple Storage Service directory buckets
         - Amazon Relational Database Service DB snapshots
         - Amazon Relational Database Service DB cluster snapshots
         - Amazon DynamoDB streams
         - Amazon DynamoDB tables
      2. Choose **Add resources**.
   b. To add resources by Amazon Resource Name (ARN), choose **Add resources > Add resources by pasting in resource ARN**.

> **Note**
>
> ARNs must be exact matches – wildcards are not supported. For Amazon S3, only bucket ARNs are supported. Amazon S3 object ARNs and prefixes are not supported.

1. For each resource ARN, enter the account owner ID and the resource ARN separated by a comma. Enter one account owner ID and resource ARN per line.
2. Choose **Add resources**.

c. To add resources by a CSV file, choose **Add resources > Add resources by uploading a CSV**.

You can use AWS Resource Explorer to search for resources in your accounts and export a CSV file. Then you can upload the CSV file to configure the resources for the analyzer to monitor.

1. Choose **Choose file** and select the CSV file from your computer.
2. Choose **Add resources**.

d. To remove resources from the analyzer, select the check box next to the resources to remove and choose **Remove**.

e. Choose **Save changes**.

> **Note**
>
> Any updates to the analyzer will be evaluated at the next automatic rescan within 24 hours.

Delete an internal access analyzer

Use the following procedure to delete an internal access analyzer. When you delete an analyzer, the resources are no longer monitored and no new findings are generated. All findings that were generated by the analyzer are deleted.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. In the **Analyzers** section, choose the name of the internal access analyzer to delete.
4. Choose **Delete analyzer**.
5. Enter **delete** and choose **Delete** to confirm deleting the analyzer.

Create an IAM Access Analyzer unused access analyzer

Create an unused access analyzer for the current account

Use the following procedure to create an unused access analyzer for a single AWS account. For unused access, findings for the analyzer do not change based on Region. Creating an analyzer in each Region where you have resources is not required.

IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per month per analyzer. For more details about pricing, see IAM Access Analyzer pricing.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Principal analysis - Unused access**.
5. Enter a name for the analyzer.
6. For **Tracking period**, enter the number of days for analysis. The analyzer will only evaluate permissions for IAM entities within the selected account that have existed for the entire tracking period. For example, if you set a tracking period of 90 days, only permissions that are at least 90 days old will be analyzed, and findings will be generated if they show no usage during this period. You can enter a value between 1 and 365 days.
7. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
8. For **Selected accounts**, choose **Current account**.

> **Note**
>
> If your account is not the AWS Organizations management account or delegated administrator account, you can create only one analyzer with your account as the selected account.

9. Optional. In the **Exclude IAM users and roles with tags** section, you can specify key-value pairs for IAM users and roles to exclude from unused access analysis. Findings will not be generated for excluded IAM users and roles that match the key-value pairs. For the **Tag key**, enter a value that is 1 to 128 characters in length and not prefixed with `aws:`. For the **Value**, you can enter a value that is 0 to 256 characters in length. If you don't enter a **Value**, the rule is applied to all principals with the specified **Tag key**. Choose **Add new exclusion** to add additional key-value pairs to exclude.
10. Optional. Add any tags that you want to apply to the analyzer.
11. Choose **Create analyzer**.

When you create an unused access analyzer to enable IAM Access Analyzer, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in your account.

Create an unused access analyzer with the current organization

Use the following procedure to create an unused access analyzer for an organization to centrally review all AWS accounts in an organization. For unused access analysis, findings for the analyzer do not change based on Region. Creating an analyzer in each Region where you have resources is not required.

IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per month per analyzer. For more details about pricing, see IAM Access Analyzer pricing.

> **Note**
>
> If a member account is removed from the organization, the unused access analyzer will stop generating new findings and updating existing findings for that account after 24 hours. Findings associated with the member account that is removed from the organization will be removed permanently after 90 days.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. Choose **Create analyzer**.
4. In the **Analysis** section, choose **Principal analysis - Unused access**.

5. Enter a name for the analyzer.
6. For **Tracking period**, enter the number of days for analysis. The analyzer will only evaluate permissions for IAM entities within the accounts of the selected organization that have existed for the entire tracking period. For example, if you set a tracking period of 90 days, only permissions that are at least 90 days old will be analyzed, and findings will be generated if they show no usage during this period. You can enter a value between 1 and 365 days.
7. In the **Analyzer details** section, confirm that the Region displayed is the Region where you want to enable IAM Access Analyzer.
8. For **Selected accounts**, choose **Current organization**.
9. Optional. In the **Exclude AWS accounts from analysis** section, you can choose AWS accounts in your organization to exclude from unused access analysis. Findings will not be generated for excluded accounts.

    a. To specify individual account IDs to exclude, choose **Specify AWS account ID** and enter the account IDs separated by commas in the **AWS account ID** field. Choose **Exclude**. The accounts are then listed in the **AWS accounts to exclude** table.

    b. To choose from a list of accounts in your organization to exclude, choose **Choose from organization**.

        i. You can search for accounts by name, email, and account ID in the **Exclude accounts from organization** field.

        ii. Choose **Hierarchy** to view your accounts by organizational unit or choose **List** to view a list of all individual accounts in your organization.

        iii. Choose **Exclude all current accounts** to exclude all accounts in an organizational unit or choose **Exclude** to exclude individual accounts.

    The accounts are then listed in the **AWS accounts to exclude** table.

> **Note**
>
> Excluded accounts cannot include the organization analyzer owner account. When new accounts are added to your organization, they are not excluded from analysis, even if you previously excluded all current accounts within an organizational unit. For more information on excluding accounts after creating an unused access analyzer, see Manage an IAM Access Analyzer unused access analyzer.

10. Optional. In the **Exclude IAM users and roles with tags** section, you can specify key-value pairs for IAM users and roles to exclude from unused access analysis. Findings will not be generated for excluded IAM users and roles that match the key-value pairs. For the **Tag key**, enter a value that is 1 to 128 characters in length and not prefixed with `aws:`. For the **Value**, you can enter a value that is 0 to 256 characters in length. If you don't enter a **Value**, the rule is applied to all principals with the specified **Tag key**. Choose **Add new exclusion** to add additional key-value pairs to exclude.
11. Optional. Add any tags that you want to apply to the analyzer.
12. Choose **Create analyzer**.

When you create an unused access analyzer to enable IAM Access Analyzer, a service-linked role named `AWSServiceRoleForAccessAnalyzer` is created in your account.

Manage an IAM Access Analyzer unused access analyzer

Use the information in this topic to learn about how to update or delete an existing unused access analyzer.

> **Note**
>
> After you create or update an analyzer, it can take time for findings to be available.

Update an unused access analyzer

Use the following procedure to update an unused access analyzer.

IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per month per analyzer. For more details about pricing, see IAM Access Analyzer pricing.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Analyzer settings**.
3. In the **Analyzers** section, choose the name of the unused access analyzer to manage.
4. On the **Exclusion** tab, if the analyzer was created for an organization as the scope of analysis, choose **Manage** in the **Excluded AWS accounts** section.

a. To specify individual account IDs to exclude, choose **Specify AWS account ID** and enter the account IDs separated by commas in the **AWS account ID** field. Choose **Exclude**. The accounts are then listed in the **AWS accounts to exclude** table.

b. To choose from a list of accounts in your organization to exclude, choose **Choose from organization**.

   i. You can search for accounts by name, email, and account ID in the **Exclude accounts from organization** field.

   ii. Choose **Hierarchy** to view your accounts by organizational unit or choose **List** to view a list of all individual accounts in your organization.

   iii. Choose **Exclude all current accounts** to exclude all accounts in an organizational unit or choose **Exclude** to exclude individual accounts.

   The accounts are then listed in the **AWS accounts to exclude** table.

c. To remove accounts to exclude, choose **Remove** next to the account in the **AWS accounts to exclude** table.

d. Choose **Save changes**.

> **Note**
>
> - Excluded accounts cannot include the organization analyzer owner account.
> - When new accounts are added to your organization, they are not excluded from analysis, even if you previously excluded all current accounts within an organizational unit.
> - After you update the exclusions for an analyzer, it can take up to two days for the list of excluded accounts to be updated.

5. On the **Exclusion** tab, choose **Manage** in the **Excluded IAM users and roles with tags** section.

   a. You can specify key-value pairs for IAM users and roles to exclude from unused access analysis. For the **Tag key**, enter a value that is 1 to 128 characters in length and not prefixed with `aws:`. For the **Value**, you can enter a value that is 0 to 256 characters in length. If you don't enter a **Value**, the rule is applied to all principals with the specified **Tag key**.

b. Choose **Add new exclusion** to add additional key-value pairs to exclude.

c. To remove key-value pairs to exclude, choose **Remove** next to the key-value pair.

d. Choose **Save changes**.

6. On the **Archive rules** tab, you can create, edit, or delete archive rules for the analyzer. For more information, see Archive rules.
7. On the **Tags** tab, you can manage and create tags for the analyzer. For more information, see Tags for AWS Identity and Access Management resources.

Delete an unused access analyzer

Use the following procedure to delete an unused access analyzer. When you delete an analyzer, the resources are no longer monitored and no new findings are generated. All findings that were generated by the analyzer are deleted.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Under **Access analyzer**, choose **Unused access**.
3. Under **Access analyzer**, choose **Analyzer settings**.
4. In the **Analyzers** section, choose the name of the unused access analyzer to delete.
5. Choose **Delete analyzer**.
6. Enter **delete** and choose **Delete** to confirm deleting the analyzer.

View the IAM Access Analyzer findings dashboard

AWS Identity and Access Management Access Analyzer organizes external, internal, and unused access findings into a visual summary dashboard. The dashboard helps you gain visibility into the effective use of permissions at scale and identify accounts and AWS resources that need attention. You can use the dashboard to review findings by AWS organization, account, and finding type.

For external and internal access findings:

- The dashboard highlights the split between public access findings, external access findings, and internal access findings.
- The dashboard provides a breakdown of findings by resource type.

For unused access findings:

- The dashboard highlights the AWS accounts with the most unused access findings.
- The dashboard provides a breakdown of findings by type.

After you create any type of access analyzer, IAM Access Analyzer automatically adds new findings to the relevant dashboard. This allows you to identify and prioritize the areas with the most security concerns.

The summary dashboards give you a high-level view of the access issues detected by IAM Access Analyzer across your AWS environment. You can then drill down into the individual findings to investigate further and take appropriate actions to resolve them.

Viewing the summary dashboard for external and internal access analyzers

> **Note**
>
> After you create or update an analyzer, it can take time for the summary dashboard to reflect updates to findings.

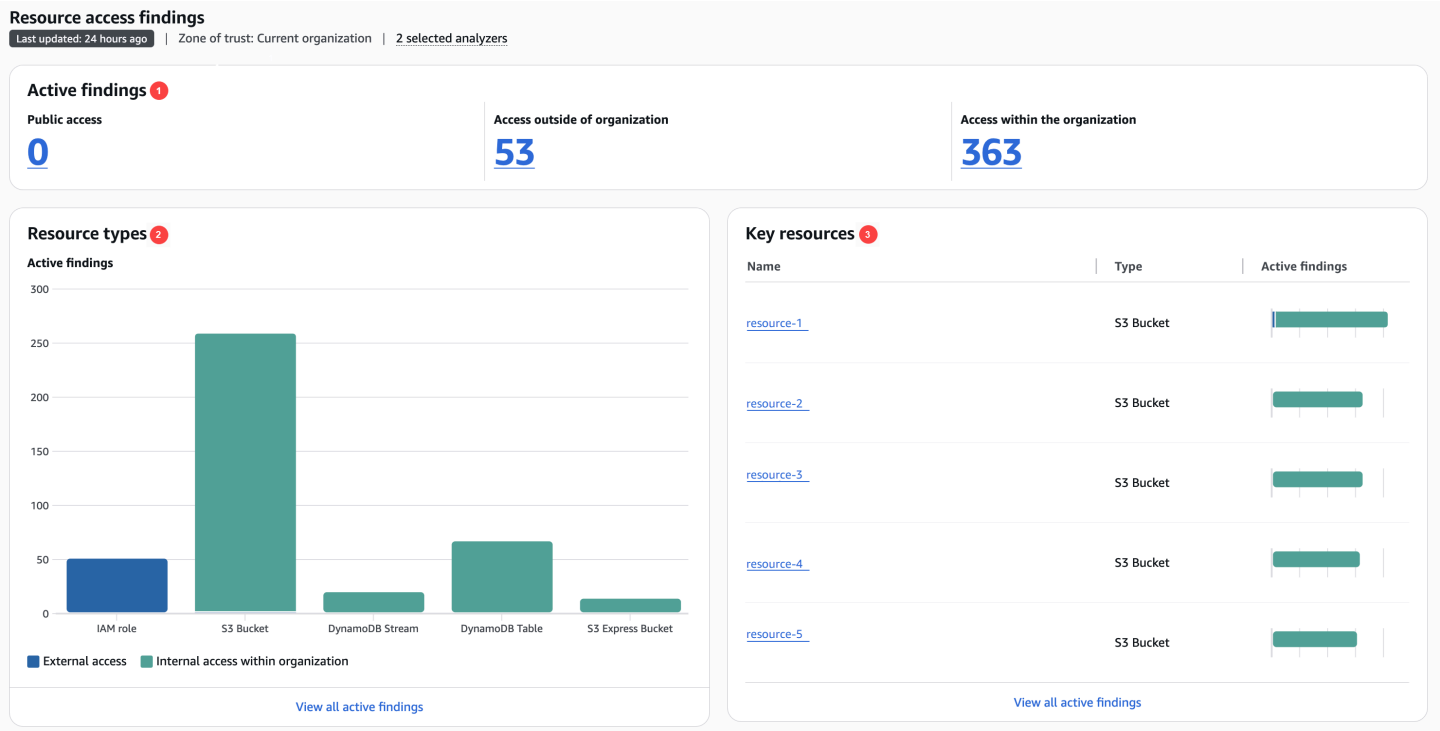
1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Access Analyzer**. The **Summary** window is displayed.
3. Choose **Select analyzers**.
4. In the **Select analyzers** window, choose **Organization** or **Account** for the **Zone of trust**.

   > **Note**
   >
   > Only the AWS Organizations management account or delegated administrator can choose **Organization** as the zone of trust.

5. Choose external and internal access analyzers from the **Resource access analyzers** dropdown.

   > **Note**
   >
   > You can select a maximum of one external access analyzer and a maximum of one internal access analyzer.

6. Choose **Update**. A summary of the findings for the selected external and internal access analyzers is displayed in the **Resource access findings** section.



In the preceding image, the resource findings dashboard is visible from within the **Summary** page.

1. The **Active findings** section includes the number of active findings for public access, the number of active findings that provide access outside of the account or organization, and the number of active internal access findings for the selected analyzers. Choose a number to list all of the active findings of each type.
2. The **Resource types** section includes a breakdown of the resource types with active findings for the selected analyzers. Choose **View all active findings** for a complete list of active findings for the selected analyzers.
3. The **Key resources** section includes a summary of the key resources with active findings. This information helps you prioritize findings for your business-critical resources. Choose **View all active findings** for a complete list of active findings for the selected analyzers.

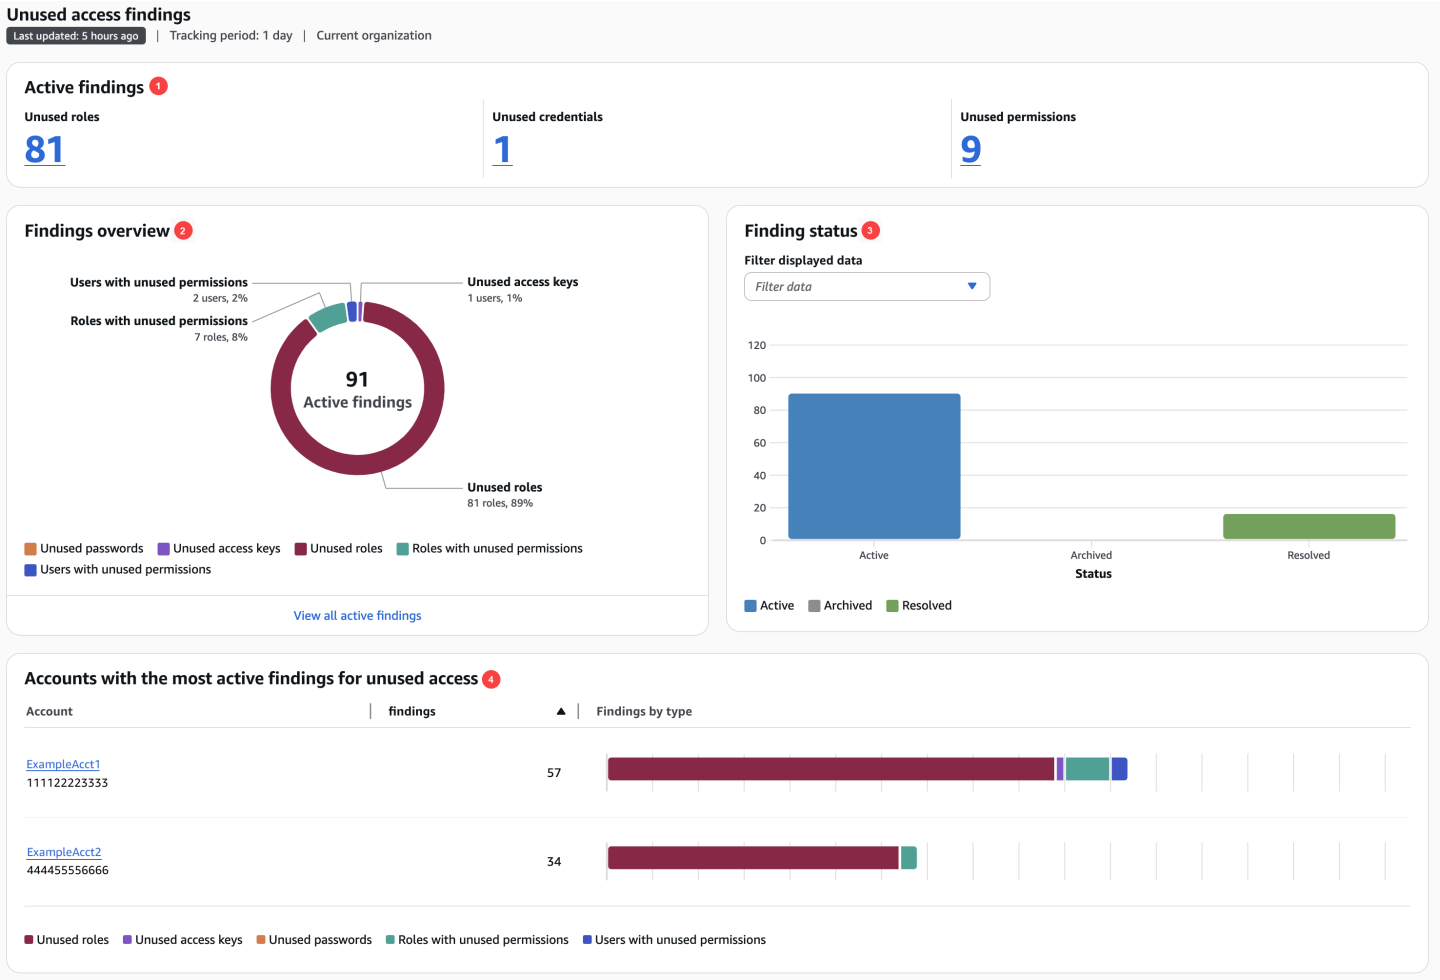
Viewing the summary dashboard for unused access analyzers

> **Note**
>
> After you create or update an analyzer, based on the amount of users and roles, it can take time for the summary dashboard to reflect updates to findings.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Access Analyzer**. The **Access Analyzer Summary** window is displayed.
3. Choose **Select analyzers**.
4. In the **Select analyzers** window, choose **Organization** or **Account** for the **Zone of trust**.

> **Note**
>
> Only the AWS Organizations management account or delegated administrator can choose **Organization** as the zone of trust.

5. Choose an unused access analyzer from the **Unused access analyzers** dropdown.
6. Choose **Update summary**. A summary of the findings for the selected unused access analyzer is displayed in the **Unused access findings** section.



In the preceding image, the unused access findings dashboard is visible from within the **Summary** page.

1. The **Active findings** section includes the number of active findings for unused roles, unused credentials, and unused permissions in your account or organization. **Unused credentials** include both unused access key and unused password findings. **Unused permissions** include both users and roles with unused permissions. Choose a number to list all of the active findings of each type.
2. The **Findings overview** section includes a breakdown of the type of active findings. Choose **View all active findings** for a complete list of active findings for the analyzer's account or organization.
3. The **Finding status** section includes a breakdown of the status of findings (**Active**, **Archived**, and **Resolved**) for your account or organization. You can select the findings statuses to display in the **Filter displayed data** dropdown.
4. The **Accounts with the most findings for unused access** section is only displayed if the selected accounts of your unused access analyzer is at the organization level. It includes a breakdown of the accounts in your organization with the most active findings. This is not an exhaustive list of every account in your organization. Your analyzer might have active findings for other accounts not listed in this section.

Review IAM Access Analyzer findings

After you enable IAM Access Analyzer, the next step is to review any findings to determine whether the access identified in the finding is intentional or unintentional. You can also review findings to determine similar findings for access that is intended, and then create an archive rule to automatically archive those findings. You can also review archived and resolved findings.

You should review all of the findings in your account to determine whether the external, internal, or unused access is expected and approved. If the access identified in the finding is expected, you can archive the finding. When you archive a finding, the status is changed to **Archived**, and the finding is removed from the active findings list. The finding is not deleted. You can view your archived findings at any time. Work through all of the findings in your account until you have zero active findings. After you get to zero findings, you know that any new **Active** findings that are generated are from a recent change in your environment.

To review active findings for all types of access analyzers

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Access analyzer**. The findings dashboard is displayed.
3. Choose **Select analyzers**.
4. In the **Select analyzers** window, choose a maximum of one external access analyzer and a maximum of one internal access analyzer from the **Resource access analyzers** dropdown. Choose an unused access analyzer from the **Unused access analyzers** dropdown.
5. Choose **Update summary**. A summary of the active findings for the selected access analyzers is displayed on the dashboard. Choose a finding type in the **Resource access findings** or **Unused access findings** sections to view all active findings of the selected type.

   For more information on viewing the findings dashboard, see View the IAM Access Analyzer findings dashboard.

> **Note**
>
> Findings are displayed only if you have permission to view findings for the analyzer.

External and internal access findings

> **Note**
>
> IAM Access Analyzer charges for internal access analysis based on the number of resources monitored per Region per month. For more details about pricing, see IAM Access Analyzer pricing.

1. Under **Access Analyzer**, choose **Resource analysis**.
2. Choose **Select analyzers**.
3. In the **Select analyzers** window, choose a maximum of one external access analyzer and a maximum of one internal access analyzer from the **Resource access analyzers** dropdown.
4. Choose **Update summary**.

The **Resource analysis** page displays the following details about the resources with active findings for the selected access analyzers:

Name

The name of the resource with active findings.

Type

The type of the resource.

Owner account

This column is displayed only if you are using an organization as the zone of trust for one or more of the selected analyzers. The account in the organization that owns the resource reported in the finding.

Active findings

A visual representation of the number and type of active findings for the resource. Hover over the field to display more information about the findings for the resource.

Public access

Indicates whether any of the findings for the resource allow public access.

Unused access findings

> **Note**
>
> IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per month. For more details about pricing, see IAM Access Analyzer pricing.

1. Under **Access Analyzer**, choose **Unused access**.
2. Choose **Select analyzers**.
3. In the **Select analyzers** window, choose an unused access analyzer from the **Unused access analyzers** dropdown.
4. Choose **Update summary**.

The **Unused access** page displays the following details about the IAM entities that generated the findings for the selected access analyzer:

Finding ID

The unique ID assigned to the finding. Choose the finding ID to display additional details about the IAM entity that generated the finding.

Finding type

The type of unused access finding: **Unused access key**, **Unused password**, **Unused permission**, or **Unused role**.

IAM entity

The IAM entity reported in the finding. This can be an IAM user or role.

AWS account ID

This column is displayed only if you set up the analyzer for all AWS accounts in the organization. The AWS account in the organization that owns the IAM entity reported in the finding.

Last updated

The last time that the IAM entity reported in the finding was updated, or when the entity was created if no updates have been made.

Status

The status of the finding (**Active**, **Archived**, or **Resolved**).

Filter IAM Access Analyzer findings

The default filtering for a findings page is to display all active findings. To view all findings, choose **All** from the **Status** dropdown. To view archived findings, choose **Archived**. To view resolved findings, choose **Resolved**. When you first start using IAM Access Analyzer, there are no archived findings.

Use filters to display only the findings that meet the specified property criteria. To create a filter, select the property to filter on, then choose whether the property equals or contains a value, then enter or choose a property value to filter on.

For a list of filter keys that you can use to create or update an archive rule, see IAM Access Analyzer filter keys.

Filtering resources with active findings

You can view and filter active findings by resource for a maximum of one external access analyzer and a maximum of one internal access analyzer.

To filter resources with active findings

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Resource analysis**.
3. To filter by resource name, type all or part of the name of the resource in the search box.
4. In the **Filter access type** dropdown, choose the access type:
   - **All types** – display resources with all types of access findings.
   - **Public access** – display only resources with public access findings.
   - **External access** – display only resources with external access findings.
   - **Internal access within organization** – display only resources with internal access findings.
5. In the **Filter resource type** dropdown, choose a resource type to display only resources of the selected type.

Filtering external access findings

To filter external access findings

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Analyzer settings** and then choose the external access analyzer in the **Analyzers** section.
3. Choose **View findings**.
4. Choose the search box to display a list of available properties.
5. Choose the property to use to filter the findings displayed.
6. Choose the value to match for the property. Only findings with that value in the finding are displayed.

For example, choose **Resource** as the property, then choose **Resource:**, then type part or all of the name of a bucket, then press Enter. Only findings for the bucket that matches the filter criteria are displayed. To create a filter that displays only findings for resources that allow public access, you can choose the **Public access** property, then choose **Public access =**, then choose **Public access = true**.

You can add additional properties to further filter the findings displayed. When you add additional properties, only findings that match all conditions in the filter are displayed. Defining a filter to display findings that match one property OR another property is not supported. Choose **Clear filters** to clear any filters you have defined and display all of the findings with the specified status for your analyzer.

Some fields are displayed only when you are viewing findings for an analyzer with an organization as its zone of trust.

The following properties are available for defining filters for external access:

- **Public access** – To filter by findings for resources that allow public access, filter by **Public access** then choose **Public access: true**.
- **Resource** – To filter by resource, type all or part of the name of the resource.
- **Resource Type** – To filter by resource type, choose the type from the list displayed.
- **Resource Owner Account** – Use this property to filter by the account in the organization that owns the resource reported in the finding.
- **Resource Control Policy Restriction** – Use this property to filter by the type of restriction applied by an Organizations resource control policy (RCP). To learn more, see Resource control policies (RCPs) in the AWS Organizations User Guide.
  - **Failed to evaluate RCP**: There was an error evaluating the RCP.
  - **Not applicable**: No RCP restricts this resource or principal. This also includes resources where RCPs are not yet supported.
  - **Applicable**: Your organization administrator has set restrictions through a RCP that impacts the resource or resource type. Contact your organization administrator for more details.
- **AWS Account** – Use this property to filter by AWS account that is granted access in the **Principal** section of a policy statement. To filter by AWS account, type all or part of the 12-digit AWS account ID, or all or part of the full account ARN of the external AWS user or role that has access to resources in the current account.

- **Canonical User** – To filter by canonical user, type the canonical user ID as defined for Amazon S3 buckets. To learn more, see AWS Account Identifiers.
- **Federated User** – To filter by federated user, type all or part of the ARN of the federated identity. To learn more, see Identity Providers and Federation.
- **Finding ID** – To filter by finding ID, type all or part of the finding ID.
- **Error** – To filter by error type, choose **Access Denied** or **Internal Error**.
- **Principal ARN** – Use this property to filter on the ARN of the principal (IAM user, role, or group) used in an **aws:PrincipalArn** condition key. To filter by Principal ARN, type all or part of the ARN of the IAM user, role, or group from an external AWS account reported in a finding.
- **Principal OrgID** – To filter by Principal OrgID, type all or part of the organization ID associated with the external principals that belong to the AWS organization specified as a condition in the finding. To learn more, see AWS global condition context keys.
- **Principal OrgPaths** – To filter by Principal OrgPaths, type all or part of the ID for the AWS organization or organizational unit (OU) that allows access to all external principals that are account members of the specified organization or OU as a condition in the policy. To learn more, see AWS global condition context keys.
- **Source Account** – To filter on Source Account, type all or part of the AWS account ID associated with the resources, as used in some cross-service permissions in AWS. To learn more, see AWS global condition context keys.
- **Source ARN** – To filter by Source ARN, type all or part of the ARN specified as a condition in the finding. To learn more, see AWS global condition context keys.
- **Source IP** – To filter by Source IP, type all or part of the IP address that allows external entities access to resources in the current account when using the specified IP address. To learn more, see AWS global condition context keys.
- **Source OrgID** – To filter by Source OrgID, type all or part of the organization ID associated with the resources, as used in some cross-service permissions in AWS. To learn more, see AWS global condition context keys.
- **Source OrgPaths** – To filter by Source OrgPaths, type all or part of the organizational unit (OU) associated with the resources, as used in some cross-service permission in AWS. To learn more, see AWS global condition context keys.
- **Source VPC** – To filter by Source VPC, type all or part of the VPC ID that allows external entities access to resources in the current account when using the specified VPC. To learn more, see AWS global condition context keys.

- **Source VPC ARN** – To filter by Source VPC ARN, type all or part of the VPC ARN that allows external entities access to resources in the current account when using the specified VPC. To learn more, see AWS global condition context keys.
- **Source VPCE** – To filter by Source VPCE, type all or part of the VPC endpoint ID that allows external entities access to resources in the current account when using the specified VPC endpoint. To learn more, see AWS global condition context keys.
- **VPCE Account** – To filter by VPCE Account, type all or part of the 12-digit AWS account ID that owns the the VPC endpoint external entities and allows external entities access to resources. To learn more, see AWS global condition context keys.
- **VPCE OrgID** – To filter by VPCE OrgID, type all or part of the organization ID that owns the VPC endpoint external entities and allows external entities access to resources. To learn more, see AWS global condition context keys.
- **VPCE OrgPaths** – To filter by VPCE OrgPaths, type all or part of the organizational unit (OU) that owns the VPC endpoint external entities and allows external entities access to resources. To learn more, see AWS global condition context keys.
- **User ID** – To filter by User ID, type all or part of the user ID of the IAM user from an external AWS account who is allowed access to resource in the current account. To learn more, see AWS global condition context keys.
- **KMS Key ID** – To filter by KMS key ID, type all or part of the key ID for the KMS key specified as a condition for AWS KMS-encrypted Amazon S3 object access in your current account.
- **Session Mode** – To filter by session mode for Amazon S3 directory buckets (`ReadOnly` or `ReadWrite`, type all or part of the session mode. To learn more, see CreateSession in the Amazon Simple Storage Service API Reference.
- **Google Audience** – To filter by Google Audience, type all or part of the Google application ID specified as a condition for IAM role access in your current account. To learn more, see IAM and AWS STS condition context keys.
- **Cognito Audience** – To filter by Amazon Cognito audience, type all or part of the Amazon Cognito identity pool ID specified as a condition for IAM role access in your current account. To learn more, see IAM and AWS STS condition context keys.
- **Caller Account** – The AWS account ID of the account that owns or contains the calling entity, such as an IAM role, user, or account root user. This is used by services calling AWS KMS. To filter by caller account, type all or part of the AWS account ID.
- **Facebook App ID** – To filter by Facebook App ID, type all or part of the Facebook application ID (or site ID) specified as a condition to allow Login with Facebook federation access to an IAM role

in your current account. To learn more, see the **id** section in IAM and AWS STS condition context keys.

- **Amazon App ID** – To filter by Amazon App ID, type all or part of the Amazon application ID (or site ID) specified as a condition to allow Login with Amazon federation access to an IAM role in your current account. To learn more, see the **id** section in IAM and AWS STS condition context keys.
- **Lambda Event Source Token** – To filter on Lambda Event Source Token passed in with Alexa integrations, type all or part of the token string.

Filtering internal access findings

To filter internal access findings

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Analyzer settings** and then choose the internal access analyzer in the **Analyzers** section.
3. Choose **View findings**.
4. Choose the search box to display a list of available properties.
5. Choose the property to use to filter the findings displayed.
6. Choose the value to match for the property. Only findings with that value in the finding are displayed.

   For example, choose **Resource** as the property, then choose **Resource:**, then type part or all of the name of a bucket, then press Enter. Only findings for the bucket that matches the filter criteria are displayed.

You can add additional properties to further filter the findings displayed. When you add additional properties, only findings that match all conditions in the filter are displayed. Defining a filter to display findings that match one property OR another property is not supported. Choose **Clear filters** to clear any filters you have defined and display all of the findings with the specified status for your analyzer.

Some fields are displayed only when you are viewing findings for an analyzer with an organization as its zone of trust.

The following fields are displayed only when you are viewing findings for an analyzer that is monitoring internal access:

- **Resource** – To filter by resource, type all or part of the name of the resource.
- **Resource Type** – To filter by resource type, choose the type from the list displayed.
- **Resource Owner Account** – Use this property to filter by the account in the organization that owns the resource reported in the finding.
- **Finding id** – To filter by finding ID, type all or part of the finding ID.

Filtering unused access findings

To filter unused access findings

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Unused access** and then choose the analyzer in the **View analyzer** dropdown.
3. Choose the search box to display a list of available properties.
4. Choose the property to use to filter the findings displayed.
5. Choose the value to match for the property. Only findings with that value in the finding are displayed.

   For example, choose **Findings type** as the property, then choose **Findings type =**, then choose **Findings type = Unused role**. Only findings with a type of **Unused role** are displayed.

You can add additional properties to further filter the findings displayed. When you add additional properties, only findings that match all conditions in the filter are displayed. Defining a filter to display findings that match one property OR another property is not supported. Choose **Clear filters** to clear any filters you have defined and display all of the findings with the specified status for your analyzer.

The following fields are displayed only when you are viewing findings for an analyzer that is monitoring unused access:

- **Findings type** – To filter by finding type, filter by **Findings type** and then choose the type of finding.
- **Resource** – To filter by resource, type all or part of the name of the resource.
- **Resource Type** – To filter by resource type, choose the type from the list displayed.

- **Resource Owner Account** – Use this property to filter by the account in the organization that owns the resource reported in the finding.
- **Finding id** – To filter by finding ID, type all or part of the finding ID.

Archive IAM Access Analyzer findings

When you get a finding for access to a resource that is intentional, you can archive the findings. For example, an external or internal access finding for an Amazon S3 bucket that is accessed for approved workflows or an unused access finding for an access key that may still be necessary. When you archive a finding, it is cleared from active findings list. Archived findings aren't deleted. You can filter the **Findings** page to display your archived findings, and unarchive them at any time.

To archive findings from the Findings page

1. Select the checkbox next to one or more findings to archive.
2. Choose **Actions** and then choose **Archive**.

   A confirmation is displayed at the top of the screen.

To archive findings from the Findings Details page

1. Choose the **Finding ID** for the finding to archive.
2. Choose **Archive**.

   A confirmation is displayed at the top of the screen.

To unarchive findings, repeat the preceding steps, but choose **Unarchive** instead of **Archive**. When you unarchive a finding, the status is set to Active.

Resolve IAM Access Analyzer findings

Resolving resource findings

To resolve external and internal access findings generated from unintended access, you should modify the policy statement to remove the permissions that allow access to the identified resource.

For findings related to Amazon S3 buckets, use the Amazon S3 console to configure the permissions on the bucket.

For IAM roles, use the IAM console to modify the trust policy for the listed IAM role.

For other supported resources, use the console to modify the policy statements that resulted in a generated finding.

After making a change to resolve a resource finding, such as modifying a policy applied to an IAM role, IAM Access Analyzer will scan the resource again. If the access to the resource is removed, the status of the finding is changed to **Resolved**. The finding will then be displayed in the resolved findings list instead of the active findings list.

> **Note**
>
> This does not apply to **Error** findings. When IAM Access Analyzer is not able to analyze a resource, it will generate an error finding. If you resolve the issue that prevented IAM Access Analyzer from analyzing the resource, the error finding will be removed completely instead of changing to a resolved finding. For more information, see IAM Access Analyzer error findings.

If the changes you made resulted in external or internal access to the resource, but in a different way, such as with a different principal or for a different permission, IAM Access Analyzer will resolve the original finding and generate a new **Active** finding. If the changes you made resulted in internal errors or access denied errors, all active non-error findings linked to the specific access of the resource are resolved and a new error finding is generated.

> **Note**
>
> For external access analyzers, it may take up to 30 minutes after a policy is modified for IAM Access Analyzer to analyze the resource again and then update the finding.
> For internal access analyzers, it might take several minutes or hours for IAM Access Analyzer to analyze the resource again and then update the finding. IAM Access Analyzer automatically rescans all policies every 24 hours.
> Resolved findings are deleted 90 days after the last update to the finding status.

Resolving unused access findings

IAM Access Analyzer provides recommended steps to resolve unused access analyzer findings based on the type of finding.

After you make a change to resolve an unused access finding, the status of the finding is changed to **Resolved** the next time the unused access analyzer runs. The finding is no longer displayed in the active findings list and instead is displayed in the resolved findings list. If you make a change that only partially addresses an unused access finding, the existing finding is changed to **Resolved** but a new finding is generated. For example, if you remove only some of the unused permissions in a finding, but not all of them.

IAM Access Analyzer charges for unused access analysis based on the number of IAM roles and users analyzed per month. For more details about pricing, see IAM Access Analyzer pricing.

Resolving unused permission findings

For unused permission findings, IAM Access Analyzer can recommend policies to remove from an IAM user or role and provide new policies to replace existing permissions policies. Policy recommendation is not supported for the following scenarios:

- The unused permission finding is for an IAM user that is in a user group.
- The unused permission finding is for an IAM role for IAM Identity Center.
- The unused permission finding has an existing permissions policy that includes the `notAction` element.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Unused access**.
3. Choose a finding with the **Finding type** of **Unused permissions**.
4. In the **Recommendations** section, if there are policies listed in the **Recommended policy** column, choose **Preview policy** to view the existing policy with the recommended policy to replace the existing policy. If there are mutliple recommended policies, you can choose **Next policy** and **Previous policy** to view each existing and recommended policy.
5. Choose **Download JSON** to download a .zip file with JSON files of all the recommended policies.
6. Create and attach the recommended policies to the IAM user or role. For more information, see Changing permissions for a user (console) and Modifying a role permissions policy (console).

7. Remove the policies listed in the **Existing permissions policy** column from the IAM user or role. For more information, see Removing a permissions from a user (console) and Modifying a role permissions policy (console).

Resolving unused role findings

For unused role findings, IAM Access Analyzer recommends deleting the unused IAM role.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Unused access**.
3. Choose a finding with the **Finding type** of **Unused role**.
4. In the **Recommendations** section, review the details of the IAM role.
5. Delete the IAM role. For more information, see Deleting an IAM role (console).

Resolving unused access key findings

For unused access key findings, IAM Access Analyzer recommends deactivating or deleting the unused access key.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Unused access**.
3. Choose a finding with the **Finding type** of **Unused access keys**.
4. In the **Recommendations** section, review the details of the access key.
5. Deactivate or delete the access key. For more information, see Managing access keys (console).

Resolving unused password findings

For unused password findings, IAM Access Analyzer recommends deleting the unused password for the IAM user.

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Unused access**.
3. Choose a finding with the **Finding type** of **Unused password**.
4. In the **Recommendations** section, review the details of the IAM user.

5. Delete the password for the IAM user. For more information, see Creating, changing, or deleting an IAM user password (console).

IAM Access Analyzer error findings

When IAM Access Analyzer analyzes resources, it typically generates findings that show who has access to your resources. However, in some cases, the analyzer might encounter issues that prevent it from completing the analysis. In these situations, IAM Access Analyzer generates error findings instead.

Error findings indicate that IAM Access Analyzer couldn't complete the analysis for a specific resource or for a specific principal-resource pair. These findings help you identify resources that might need attention to ensure proper analysis.

External access error findings

External access analyzers, which identify resources shared outside your account or organization, can generate two types of error findings:

- INTERNAL_ERROR – Indicates that IAM Access Analyzer encountered an internal issue while analyzing the resource. This could be due to service limitations or temporary issues.

```
{
 "findingDetails": [
  {
   "externalAccessDetails": {}
  }
 ],
 "resource": "arn:aws:iam::941407043048:role/TestAccessAnalyzer",
 "status": "ACTIVE",
 "error": "INTERNAL_ERROR",
 "createdAt": "2022-07-14T01:31:43.085000+00:00",
 "resourceType": "AWS::IAM::Role",
 "findingType": "ExternalAccess",
 "resourceOwnerAccount": "941407043048",
 "analyzedAt": "2025-03-19T06:51:46.109000+00:00",
 "id": "4b035c7d-b7d2-40e4-a6c3-9887d1a995df",
 "updatedAt": "2022-07-14T01:31:43.085000+00:00"
}
```

- ACCESS_DENIED – Indicates that IAM Access Analyzer doesn't have the required permissions to analyze the resource. This typically happens when the service-linked role (SLR) for IAM Access Analyzer is denied access to the resource.

```
{
 "findingDetails": [
  {
   "externalAccessDetails": {}
  }
 ],
 "resource": "arn:aws:kms:us-west-2:941407043048:key/01cae123-
b7f2-4488-9a05-0070a072ea2c",
 "status": "ACTIVE",
 "error": "ACCESS_DENIED",

 "updatedAt": "2022-07-14T01:31:43.104000+00:00"
}
```

Internal access error findings

Internal access analyzers, which identify access within your account or organization, can generate four types of error findings:

- PRINCIPAL_LIMIT_EXCEEDED – Generated when more than 3,000 principals have access to a critical resource. This error helps you identify resources with overly broad access that might need to be restricted.

  If you make changes to the resource or principals in your environment that bring the number of principals below the limit, the analyzer will generate normal findings during the next scan, and the error finding will be marked as resolved.

```
{
 "id": "efec28fe-b304-412f-af0f-704d0d70c79c",
 "status": "ACTIVE",
 "error": "PRINCIPAL_LIMIT_EXCEEDED",
```

```
 "resource": "arn:aws:s3:::critical-data",
 "resourceType": "AWS::S3::Bucket",
 "resourceOwnerAccount": "111122223333",
 "createdAt": "2023-11-30T00:56:56.437000+00:00",
 "analyzedAt": "2024-03-06T04:11:54.406000+00:00",
 "updatedAt": "2023-11-30T00:56:56.437000+00:00",
 "findingType": "InternalAccess",
 "findingDetails": [
  {
   "internalAccessDetails": {}
  }
 ]
}
```

- Resource-level errors (INTERNAL_ERROR or ACCESS_DENIED) – Similar to external access errors, these indicate that the analyzer couldn't analyze a specific resource due to internal issues or permission problems. When a resource-level error occurs, the analyzer generates a single error finding for the resource instead of normal findings.

```
{
 "id": "efec28fe-b304-412f-af0f-704d0d70c79c",
 "status": "ACTIVE",
 "error": "INTERNAL_ERROR", // can be INTERNAL_ERROR or ACCESS_DENIED
 "resource": "arn:aws:s3:::critical-data",
 "resourceType": "AWS::S3::Bucket",
 "resourceOwnerAccount": "111122223333",
 "createdAt": "2023-11-30T00:56:56.437000+00:00",
 "analyzedAt": "2024-03-06T04:11:54.406000+00:00",
 "updatedAt": "2023-11-30T00:56:56.437000+00:00",
 "findingType": "InternalAccess",
 "findingDetails": [
  {
   "internalAccessDetails": {}
  }
 ]
}
```

- Principal-level errors (INTERNAL_ERROR or ACCESS_DENIED) – Indicates that the analyzer couldn't analyze access for a specific principal to a specific resource. Unlike resource-level errors, a resource can have both normal findings for some principals and error findings for other principals.

```
{
 "id": "efec28fe-b304-412f-af0f-704d0d70c79c",
 "status": "ACTIVE",
 "error": "INTERNAL_ERROR", // can be INTERNAL_ERROR or ACCESS_DENIED
 "resource": "arn:aws:s3:::critical-data",
 "resourceType": "AWS::S3::Bucket",
 "resourceOwnerAccount": "111122223333",
 "createdAt": "2023-11-30T00:56:56.437000+00:00",
 "analyzedAt": "2024-03-06T04:11:54.406000+00:00",
 "updatedAt": "2023-11-30T00:56:56.437000+00:00",
 "findingType": "InternalAccess",
 "findingDetails": [
  {
   "internalAccessDetails": {
    "principal": {
     "AWS": "arn:aws:iam::111122223333:role/MyRole_1"
    },
    "principalOwnerAccount": "111122223333",
    "principalType": "IAM_ROLE",
    "accessType": "INTRA_ACCOUNT"
   }
  }
 ]
}
```

- PRINCIPAL_ERRORS_LIMIT_EXCEEDED – Generated when there are too many principal-level error findings for a single resource. This is a resource-level error finding that may appear alongside normal findings for the same resource.

```
{
 "id": "efec28fe-b304-412f-af0f-704d0d70c79c",
 "status": "ACTIVE",
 "error": "PRINCIPAL_ERRORS_LIMIT_EXCEEDED",
 "resource": "arn:aws:s3:::critical-data",
 "resourceType": "AWS::S3::Bucket",
 "resourceOwnerAccount": "111122223333",
 "createdAt": "2023-11-30T00:56:56.437000+00:00",
 "analyzedAt": "2024-03-06T04:11:54.406000+00:00",
 "updatedAt": "2023-11-30T00:56:56.437000+00:00",
 "findingType": "InternalAccess",
 "resourceControlPolicyRestriction": "NOT_APPLICABLE",
 "serviceControlPolicyRestriction": "NOT_APPLICABLE",
```

```
 "findingDetails": [
  {
   "internalAccessDetails": {}
  }
 ]
}
```

Resolving error findings

If you resolve the issue that prevented IAM Access Analyzer from analyzing the resource, the error finding will be removed completely instead of changing to a resolved finding.

To resolve error findings, consider the following approaches based on the error type:

- For ACCESS_DENIED errors, verify that the IAM Access Analyzer service-linked role has the necessary permissions to access the resource.
- For PRINCIPAL_LIMIT_EXCEEDED errors, review the resource's access policies and consider restricting access to fewer principals.
- For INTERNAL_ERROR findings, you may need to wait for a subsequent analysis cycle or contact AWS support if the issue persists.
- For PRINCIPAL_ERRORS_LIMIT_EXCEEDED, review and potentially simplify the access patterns for the affected resource.

After making changes to address the underlying issues, IAM Access Analyzer will attempt to analyze the resources again during its next scan cycle.

IAM Access Analyzer supported resource types for external and internal access

For external and internal access analyzers, IAM Access Analyzer analyzes the resource-based policies that are applied to AWS resources in the Region where you enabled IAM Access Analyzer. It only analyzes resource-based policies. For details about how IAM Access Analyzer generates findings for each resource type, review the resource type information.

> **Note**
>
> The supported resource types listed are for external and internal access analyzers. Internal access analyzers don't support all resource types that external access analyzers support.

Unused access analyzers only support IAM users and roles. For more information, see Understand how IAM Access Analyzer findings work.

Supported resource types for external access

- Amazon Simple Storage Service buckets
- Amazon Simple Storage Service directory buckets
- AWS Identity and Access Management roles
- AWS Key Management Service keys
- AWS Lambda functions and layers
- Amazon Simple Queue Service queues
- AWS Secrets Manager secrets
- Amazon Simple Notification Service topics
- Amazon Elastic Block Store volume snapshots
- Amazon Relational Database Service DB snapshots
- Amazon Relational Database Service DB cluster snapshots
- Amazon Elastic Container Registry repositories
- Amazon Elastic File System file systems
- Amazon DynamoDB streams
- Amazon DynamoDB tables

Supported resource types for internal access

- Amazon Simple Storage Service buckets
- Amazon Simple Storage Service directory buckets
- Amazon Relational Database Service DB snapshots
- Amazon Relational Database Service DB cluster snapshots
- Amazon DynamoDB streams
- Amazon DynamoDB tables

Amazon Simple Storage Service buckets

When IAM Access Analyzer analyzes Amazon S3 buckets for external access analyzers, it generates a finding when an Amazon S3 bucket policy, access control list (ACL), or access point, including a multi-Region access point, applied to a bucket grants access to an external entity. An external entity is a principal or other entity that you can use to create a filter that isn't within your zone of trust. For example, if a bucket policy grants access to another account or allows public access, IAM Access Analyzer generates a finding. However, if you enable Block Public Access on your bucket, you can block access at the account level or the bucket level.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified Amazon S3 bucket.

> **Note**
>
> IAM Access Analyzer doesn't analyze the access point policy attached to cross-account access points because the access point and its policy are outside the analyzer account. IAM Access Analyzer generates a public finding when a bucket delegates access to a cross-account access point and Block Public Access is not enabled on the bucket or account. When you enable Block Public Access, the public finding is resolved and IAM Access Analyzer generates a cross-account finding for the cross-account access point.

Amazon S3 *Block Public Access* settings override the bucket policies applied to the bucket. The settings also override the access point policies applied to the bucket's access points. IAM Access Analyzer analyzes Block Public Access settings at the bucket level whenever a policy changes. However, it evaluates the Block Public Access settings at the account level only once every 6 hours. This means that IAM Access Analyzer might not generate or resolve a finding for public access to a bucket for up to 6 hours. For example, if you have a bucket policy that allows public access, IAM Access Analyzer generates a finding for that access. If you then enable Block Public Access to block all public access to the bucket at the account level, IAM Access Analyzer doesn't resolve the finding for the bucket policy for up to 6 hours, even though all public access to the bucket is blocked. Resolution of public findings for cross-account access points can also take up to 6 hours once you enable Block Public Access at the account level. Changes to a resource control policy (RCP) without a change to the bucket policy do not trigger a rescan of the bucket reported in the finding. IAM Access Analyzer analyzes the new or updated policy during the next periodic scan, which is within 24 hours.

For a multi-Region access point, IAM Access Analyzer uses an established policy for generating findings. IAM Access Analyzer evaluates changes to multi-Region access points once every 6 hours. This means IAM Access Analyzer doesn't generate or resolve a finding for up to 6 hours, even if you create or delete a multi-Region access point, or update the policy for it.

Amazon Simple Storage Service directory buckets

Amazon S3 directory buckets organize data hierarchically into directories as opposed to the flat storage structure of general purpose buckets, which is recommended for performance-critical workloads or applications. For external access analyzers, IAM Access Analyzer analyzes the directory bucket policy, including condition statements in a policy, that allow an external entity to access a directory bucket.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified Amazon S3 directory bucket.

Amazon S3 directory buckets also support access points, which enforce distinct permissions and network controls for all requests made to the directory bucket through the access point. Each access point can have an access point policy that works in conjunction with the bucket policy that is attached to the underlying directory bucket. With access points for directory buckets, you can restrict access to specific prefixes, API actions, or a virtual private cloud (VPC).

> **Note**
>
> IAM Access Analyzer doesn't analyze the access point policy attached to cross-account access points because the access point and its policy are outside the analyzer account. IAM Access Analyzer generates a public finding when a bucket delegates access to a cross-account access point and Block Public Access is not enabled on the bucket or account. When you enable Block Public Access, the public finding is resolved and IAM Access Analyzer generates a cross-account finding for the cross-account access point.

For more information about Amazon S3 directory buckets, see Working with directory buckets in the Amazon Simple Storage Service User Guide.

AWS Identity and Access Management roles

For IAM roles, IAM Access Analyzer analyzes trust policies. In a role trust policy, you define the principals that you trust to assume the role. A role trust policy is a required resource-based policy

that is attached to a role in IAM. IAM Access Analyzer generates findings for roles within the zone of trust that can be accessed by an external entity that is outside your zone of trust.

> **Note**
>
> An IAM role is a global resource. If a role trust policy grants access to an external entity, IAM Access Analyzer generates a finding in each enabled Region.

AWS Key Management Service keys

For AWS KMS keys, IAM Access Analyzer analyzes the key policies and grants applied to a key. IAM Access Analyzer generates a finding if a key policy or grant allows an external entity to access the key. For example, if you use the kms:CallerAccount condition key in a policy statement to allow access to all users in a specific AWS account, and you specify an account other than the current account (the zone of trust for the current analyzer), IAM Access Analyzer generates a finding. To learn more about AWS KMS condition keys in IAM policy statements, see AWS KMS Condition Keys.

When IAM Access Analyzer analyzes a KMS key it reads key metadata, such as the key policy and list of grants. If the key policy doesn't allow the IAM Access Analyzer role to read the key metadata, an Access Denied error finding is generated. For example, if the following example policy statement is the only policy applied to a key, it results in an Access denied error finding in IAM Access Analyzer.

```
{
    "Sid": "Allow access for Key Administrators",
    "Effect": "Allow",
    "Principal": {
       "AWS": "arn:aws:iam::111122223333:role/Admin"
    },
    "Action": "kms:*",
    "Resource": "*"
}
```

Because this statement allows only the role named *Admin* from the AWS account 111122223333 to access the key, an Access Denied error finding is generated because IAM Access Analyzer isn't able to fully analyze the key. An error finding is displayed in red text in the **Findings** table. The finding looks similar to the following.

```
{
    "error": "ACCESS_DENIED",
```

```
    "id": "12345678-1234-abcd-dcba-111122223333",
    "analyzedAt": "2019-09-16T14:24:33.352Z",
    "resource": "arn:aws:kms:us-
west-2:1234567890:key/1a2b3c4d-5e6f-7a8b-9c0d-1a2b3c4d5e6f7g8a",
    "resourceType": "AWS::KMS::Key",
    "status": "ACTIVE",
    "updatedAt": "2019-09-16T14:24:33.352Z"
}
```

When you create a KMS key, the permissions granted to access the key depend on how you create the key. If you receive an Access Denied error finding for a key resource, apply the following policy statement to the key resource to grant IAM Access Analyzer permission to access the key.

```
{
    "Sid": "Allow IAM Access Analyzer access to key metadata",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/aws-service-role/access-
analyzer.amazonaws.com/AWSServiceRoleForAccessAnalyzer"
        },
    "Action": [
        "kms:DescribeKey",
        "kms:GetKeyPolicy",
        "kms:List*"
    ],
    "Resource": "*"
},
```

After you receive an Access Denied finding for a KMS key resource, and then resolve the finding by updating the key policy, the finding is updated to a status of Resolved. If there are policy statements or key grants that grant permission to the key to an external entity, you might see additional findings for the key resource.

AWS Lambda functions and layers

For AWS Lambda functions, IAM Access Analyzer analyzes policies, including condition statements in a policy, that grant access to the function to an external entity. With Lambda, you can attach unique resource-based policies to functions, versions, aliases, and layers. IAM Access Analyzer reports external access based on resource-based policies attached to functions and layers. IAM Access Analyzer doesn't report external access based on resource-based policies attached to aliases and specific versions invoked using a qualified ARN.

For more information, see Using resource-based policies for Lambda and Using versions in the AWS Lambda Developer Guide.

Amazon Simple Queue Service queues

For Amazon SQS queues, IAM Access Analyzer analyzes policies, including condition statements in a policy, that allow an external entity access to a queue.

AWS Secrets Manager secrets

For AWS Secrets Manager secrets, IAM Access Analyzer analyzes policies, including condition statements in a policy, that allow an external entity to access a secret.

Amazon Simple Notification Service topics

IAM Access Analyzer analyzes resource-based policies attached to Amazon SNS topics, including condition statements in the policies that allow external access to a topic. You can allow external accounts to perform Amazon SNS actions such as subscribing to and publishing topics through a resource-based policy. An Amazon SNS topic is externally accessible if principals from an account outside of your zone of trust can perform operations on the topic. When you choose `Everyone` in your policy when creating an Amazon SNS topic, you make the topic accessible to the public. `AddPermission` is another way to add a resource-based policy to an Amazon SNS topic that allows external access.

Amazon Elastic Block Store volume snapshots

Amazon Elastic Block Store volume snapshots do not have resource-based policies. A snapshot is shared through Amazon EBS sharing permissions. For Amazon EBS volume snapshots, IAM Access Analyzer analyzes access control lists that allow an external entity access to a snapshot. An Amazon EBS volume snapshot can be shared with external accounts when encrypted. An unencrypted volume snapshot can be shared with external accounts and grant public access. Sharing settings are in the `CreateVolumePermissions` attribute of the snapshot. When customers preview external access of an Amazon EBS snapshot, they can specify the encryption key as an indicator that the snapshot is encrypted, similar to how IAM Access Analyzer preview handles Secrets Manager secrets.

Amazon Relational Database Service DB snapshots

Amazon RDS DB snapshots do not have resource-based policies. A DB snapshot is shared through Amazon RDS database permissions, and only manual DB snapshots can be shared. For external

access analyzers, IAM Access Analyzer analyzes access control lists that allow an external entity access to a Amazon RDS DB snapshot. Unencrypted DB snapshots can be public. Encrypted DB snapshots cannot be shared publicly, but they can be shared with up to 20 other accounts. For more information, see Creating a DB snapshot. IAM Access Analyzer considers the ability to export a database manual snapshot (for example, to an Amazon S3 bucket) as trusted access.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified Amazon RDS DB snapshot.

Note

IAM Access Analyzer does not identify public or cross-account access configured directly on the database itself. IAM Access Analyzer only identifies findings for public or cross-account access configured on the Amazon RDS DB snapshot.

Amazon Relational Database Service DB cluster snapshots

Amazon RDS DB cluster snapshots do not have resource-based policies. A snapshot is shared through Amazon RDS DB cluster permissions. For external access analyzers, IAM Access Analyzer analyzes access control lists that allow an external entity access to a Amazon RDS DB cluster snapshot. Unencrypted cluster snapshots can be public. Encrypted cluster snapshots cannot be shared publicly. Both unencrypted and encrypted cluster snapshots can be shared with up to 20 other accounts. For more information, see Creating a DB cluster snapshot. IAM Access Analyzer considers the ability to export a DB cluster snapshot (for example, to an Amazon S3 bucket) as trusted access.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified Amazon RDS DB cluster snapshot.

Note

IAM Access Analyzer findings do not include monitoring of any share of Amazon RDS DB clusters and clones with another AWS account or organization using AWS Resource Access Manager. IAM Access Analyzer only identifies findings for public or cross-account access configured on the Amazon RDS DB cluster snapshot.

Amazon Elastic Container Registry repositories

For Amazon ECR repositories, IAM Access Analyzer analyzes resource-based policies, including condition statements in a policy, that allow an external entity access to a repository (similar to other resource types like Amazon SNS topics and Amazon EFS file systems). For Amazon ECR repositories, a principal must have permission to `ecr:GetAuthorizationToken` through an identity-based policy to be considered externally available.

Amazon Elastic File System file systems

For Amazon EFS file systems, IAM Access Analyzer analyzes policies, including condition statements in a policy, that allow an external entity access to a file system. An Amazon EFS file system is externally accessible if principals from an account outside of your zone of trust can perform operations on that file system. Access is defined by a file system policy that uses IAM, and by how the file system is mounted. For example, mounting your Amazon EFS file system in another account is considered externally accessible, unless that account is in your organization and you have defined the organization as your zone of trust. If you are mounting the file system from a virtual private cloud with a public subnet, the file system is externally accessible. When you use Amazon EFS with AWS Transfer Family, file system access requests received from a Transfer Family server that is owned by a different account than the file system are blocked if the file system allows public access.

Amazon DynamoDB streams

For external access analyzers, IAM Access Analyzer generates a finding if a DynamoDB policy allows at least one cross-account action that allows an external entity to access a DynamoDB stream. For more information on the supported cross-account actions for DynamoDB, see IAM actions supported by resource-based policies in the Amazon DynamoDB Developer Guide.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified DynamoDB stream.

Amazon DynamoDB tables

For external access analyzers, IAM Access Analyzer generates a finding for a DynamoDB table if a DynamoDB policy allows at least one cross-account action that allows an external entity to access a DynamoDB table or index. For more information on the supported cross-account actions for DynamoDB, see IAM actions supported by resource-based policies in the Amazon DynamoDB Developer Guide.

For internal access analyzers, IAM Access Analyzer generates a finding when a principal (user or role) within your organization or account has access to a specified DynamoDB table.

Delegated administrator for IAM Access Analyzer

If you're configuring AWS Identity and Access Management Access Analyzer in your AWS Organizations management account, you can add a member account in the organization as the delegated administrator to manage IAM Access Analyzer for your organization. The delegated administrator has permissions to create and manage analyzers within the organization. Only the management account can add a delegated administrator.

The delegated administrator for IAM Access Analyzer is a member account within the organization that has permissions to create and manage analyzers that analyze access across the organization. Only the management account can add, remove, or change a delegated administrator.

If you add a delegated administrator, you can later change to a different account for the delegated administrator. When you do, the former delegated administrator account loses permission to all analyzers that were created using that account to analyze access across the organization. These analyzers move to a disabled state and no longer generate new or update existing findings. The existing findings for these analyzers are also no longer accessible. You can access them again in the future by configuring the account as the delegated administrator. If you know that you won't use the same account as a delegated administrator, consider deleting the analyzers before changing the delegated administrator. This deletes all findings generated. When the new delegated administrator creates new analyzers, new instances of the same findings are generated. You don't lose any findings, they just get generated for the new analyzer in a different account. And you can continue to access findings for the organization using the organization management account, which also has administrator permissions. The new delegated administrator must create new analyzers for IAM Access Analyzer to start monitoring resources in your organization.

If the delegated administrator leaves the AWS organization, the delegated administration privileges are removed from the account. All analyzers in the account with the organization as the zone of trust move to a disabled state. The existing findings for these analyzers are also no longer accessible.

The first time that you configure analyzers in the management account, you can choose **Add delegated administrator** on the **Analyzer settings** page in the IAM Access Analyzer console.

> **Note**
>
> IAM Access Analyzer charges for unused access analyzers based on the number of IAM roles and users analyzed per analyzer per month. If you create an unused access analyzer in the management account and the delegated administrator account, you will be charged for both unused access analyzers. For more details about pricing, see IAM Access Analyzer pricing.

After you change the delegated administrator, the new administrator must create analyzers to start monitoring access to the resources in your organization.

Add a delegated administrator for IAM Access Analyzer

If you're configuring AWS Identity and Access Management Access Analyzer in your AWS Organizations management account, you can add a member account in the organization as the delegated administrator to manage IAM Access Analyzer for your organization. The delegated administrator has permissions to create and manage analyzers within the organization. Only the management account can add a delegated administrator.

To add a delegated administrator using the console

1. Log in to the AWS console using the management account for your organization.
2. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
3. Under **Access Analyzer**, choose **Analyzer settings**.
4. Choose **Add delegated administrator**.
5. In the **Delegated administrator** field, enter the AWS account number of an organization member account to make the delegated administrator.

   The account must be a member of your organization.
6. Choose **Save changes**.

To add a delegated administrator using the AWS CLI or the AWS SDKs

When you create an analyzer to analyzer access across the organization in a delegated administrator account using the AWS CLI, AWS API (using the AWS SDKs) or CloudFormation, you must use AWS Organizations APIs to enable service access for IAM Access Analyzer and register the member account as a delegated administrator.

1. Enable trusted service access for IAM Access Analyzer in AWS Organizations. See How to Enable or Disable Trusted Access in the AWS Organizations User Guide.
2. Register a valid member account of your AWS organization as a delegated administrator using the AWS Organizations `RegisterDelegatedAdministrator` API operation or the `register-delegated-administrator` AWS CLI command.

Archive rules

Archive rules automatically archive new findings that meet the criteria you define when you create the rule. You can also apply archive rules retroactively to archive existing findings that meet the archive rule criteria. For example, you can create an archive rule to automatically archive any findings for a specific Amazon S3 bucket that you regularly grant access to. Or if you grant access to multiple resources to a specific principal, you can create a rule that automatically archives any new finding generated for access granted to that principal. This lets you focus only on active findings that may indicate a security risk.

When you create an archive rule, only new findings that match the rule criteria are automatically archived. Existing findings are not automatically archived. When you create a rule, you can include up to 20 values per criterion in the rule. For a list of filter keys that you can use to create or update an archive rule, see IAM Access Analyzer filter keys.

> **Note**
>
> When you create or edit an archive rule, IAM Access Analyzer does not validate the values you include in the filter for the rule. For example, if you add a rule to match an AWS account, IAM Access Analyzer accepts any value in the field, even if it is not a valid AWS account number.

To create an archive rule

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. Choose **Access analyzer**, then choose **Analyzer settings**.
3. In the **Analyzers** section, choose the analyzer for which you want to create an archive rule.
4. On the **Archive rules** tab, choose **Create archive rule**.
5. Enter a name for the rule if you want to change the default name.

6. In the **Rule** section, under **Criteria**, select a property to match for the rule.
7. Choose an condition for the property value, such as **Contains**, **Is**, or **Not Equals**.

   The operators available depend on the property you choose.
8. Optionally, add additional values for the property, or add additional criteria for the rule. For external access findings, to ensure that your rule won't archive new findings for public access, you can also include the criterion **Public access** and set it to **false**.

   To add another value for a criterion, choose **Add another value**. To add another criterion for the rule, choose **Add criterion**.
9. When you finish adding criteria and values, choose **Create rule** to apply the rule to new findings only. Choose **Create and archive active findings** to archive new and existing findings based on the rule criteria. In the **Results** section, you can review the list of active findings the archive rule applies to.

For example, to create a rule for external access findings that automatically archives any findings for Amazon S3 buckets: choose **Resource type**, and then choose **Is** for the condition. Next choose **S3 bucket** from the **Value** list.

To create a rule for unused access findings that automatically archives any finding for a particular account: choose **Resource Owner Account**, and then choose **Equals** for the condition. Type the AWS account ID in the **Value** text box.

Continue to define criteria to customize the rule as appropriate for your environment, and then choose **Create rule**.

If you are create a new rule and add multiple criteria, you can remove a single criterion from the rule by choosing **Remove this criterion**. You can remove a value added for a criterion by choosing **Remove value**.

To edit an archive rule

1. Choose name of the rule to edit in the **Name** column.

   You can edit only one archive rule at a time.
2. Add new criteria or remove the existing criteria and values for each criterion.
3. Choose **Save changes** to apply the rule to new findings only. Choose **Save and archive active findings** to archive new and existing findings based on the rule criteria.

To delete an archive rule

1. Select the checkbox for the rules that you want to delete.
2. Choose **Delete**.
3. Type **`delete`** in the **Delete archive rule** confirmation dialog, and then choose **Delete**.

The rules are deleted only from the analyzer in the current Region. You must delete archive rules separately for each analyzer that you created in other Regions.

Monitoring AWS Identity and Access Management Access Analyzer with Amazon EventBridge

Use the information in this topic to learn how to monitor IAM Access Analyzer findings and access previews with Amazon EventBridge. EventBridge is the new version of Amazon CloudWatch Events.

Findings events

IAM Access Analyzer sends an event to EventBridge for each generated finding, for a change to the status of an existing finding, and when a finding is deleted. To receive findings and notifications about findings, you must create an event rule in Amazon EventBridge. When you create an event rule, you can also specify a target action to trigger based on the rule. For example, you could create an event rule that triggers an Amazon SNS topic when an event for a new finding is received from IAM Access Analyzer. Details about the resource control policy (RCP) are available in the event detail section.

Access preview events

IAM Access Analyzer sends an event to EventBridge for each access preview and change to its status. This includes an event when the access preview is first created (status Creating), when the access preview is complete (status Completed), or when the access preview creation failed (status Failed). To receive notifications about access previews, you must create an event rule in EventBridge. When you create an event rule, you can specify a target action to trigger based on the rule. For example, you could create an event rule that triggers an Amazon SNS topic when an event for a completed access preview is received from IAM Access Analyzer.

Event notification frequency

IAM Access Analyzer sends events for new findings and findings with status updates to EventBridge within about an hour from when the event occurs in your account. IAM Access Analyzer also sends

events to EventBridge when a resolved finding is deleted because the retention period has expired. For findings that are deleted because the analyzer that generated them is deleted, the event is sent to EventBridge approximately 24 hours after the analyzer was deleted. When a finding is deleted, the finding status is not changed. Instead, the `isDeleted` attribute is set to `true`. IAM Access Analyzer also sends events for newly created access previews and access preview status changes to EventBridge.

Example external access findings events

The following is an example IAM Access Analyzer external access finding event sent to EventBridge. The `id` listed is the ID for the event in EventBridge. To learn more, see Events and Event Patterns in EventBridge.

In the `detail` object, the values for the `accountId` and `region` attributes refer to the account and region reported in the finding. The `isDeleted` attribute indicates whether the event was from the finding being deleted. The `id` is the finding ID. The `resources` array is a singleton with the ARN of the analyzer that generated the finding.

```
{
    "account": "111122223333",
    "detail": {
        "accountId": "111122223333",
        "action": [
            "s3:GetObject"
        ],
        "analyzedAt": "2019-11-21T01:22:22Z",
        "condition": {},
        "createdAt": "2019-11-20T04:58:50Z",
        "id": "22222222-dcba-4444-dcba-333333333333",
        "isDeleted": false,
        "isPublic": false,
        "principal": {
            "AWS": "999988887777"
        },
        "region": "us-west-2",
        "resource": "arn:aws:s3:::amzn-s3-demo-bucket",
        "resourceType": "AWS::S3::Bucket",
        "status": "ACTIVE",
        "updatedAt": "2019-11-21T01:14:07Z",
        "version": "1.0"
    },
```

```
    "detail-type": "Access Analyzer Finding",
    "id": "11111111-2222-4444-aaaa-333333333333",
    "region": "us-west-2",
    "resources": [
        "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/MyAnalyzer"
    ],
    "source": "aws.access-analyzer",
    "time": "2019-11-21T01:22:33Z",
    "version": "0"
}
```

IAM Access Analyzer also sends events to EventBridge for error findings. An error finding is a finding generated when IAM Access Analyzer can't analyze the resource. Events for error findings include an `error` attribute as shown in the following example.

```
{
    "account": "111122223333",
    "detail": {
        "accountId": "111122223333",
        "analyzedAt": "2019-11-21T01:22:22Z",
        "createdAt": "2019-11-20T04:58:50Z",
        "error": "ACCESS_DENIED",
        "id": "22222222-dcba-4444-dcba-333333333333",
        "isDeleted": false,
        "region": "us-west-2",
        "resource": "arn:aws:s3:::amzn-s3-demo-bucket",
        "resourceType": "AWS::S3::Bucket",
        "status": "ACTIVE",
        "updatedAt": "2019-11-21T01:14:07Z",
        "version": "1.0"
    },
    "detail-type": "Access Analyzer Finding",
    "id": "11111111-2222-4444-aaaa-333333333333",
    "region": "us-west-2",
    "resources": [
        "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/MyAnalyzer"
    ],
    "source": "aws.access-analyzer",
    "time": "2019-11-21T01:22:33Z",
    "version": "0"
}
```

Example internal access findings events

The following is an example IAM Access Analyzer internal access finding event sent to EventBridge. The `id` listed is the ID for the event in EventBridge. To learn more, see Events and Event Patterns in EventBridge.

In the `detail` object, the values for the `accountId` and `principalOwnerAccount` attributes refer to the account of the principal reported in the finding. The `isDeleted` attribute indicates whether the event was from the finding being deleted. The `id` is the finding ID. The `resource` is the ARN of the analyzer that generated the finding.

```
{
    "version": "0",
    "id": "b45c3678-c278-b593-6121-c155259ce1b5",
    "detail-type": "Internal Access Finding",
    "source": "aws.access-analyzer",
    "account": "111122223333",
    "time": "2025-04-08T19:42:49Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:access-analyzer:us-east-1:111122223333:analyzer/testAnalyzer"
    ],
    "detail": {
        "accessType": "INTRA_ACCOUNT",
        "action": [
            "s3:GetObject"
        ],
        "analyzedAt": "2025-04-08T03:18:43.509465073Z",
        "condition": {},
        "createdAt": "2025-04-07T21:33:49.914099224Z",
        "id": "11111111-2222-4444-aaaa-333333333333",
        "isDeleted": false,
        "findingType": "InternalAccess",
        "principal": {
            "AWS": "arn:aws:iam::111122223333:role/MyRole_6"
        },
        "principalOwnerAccount": "111122223333",
        "principalType": "IAM_ROLE",
        "resource": "arn:aws:s3:::critical-data",
        "resourceControlPolicyRestrictionType": "NOT_APPLICABLE",
        "accountId": "111122223333",
        "resourceType": "AWS::S3::Bucket",
        "serviceControlPolicyRestrictionType": "NOT_APPLICABLE",
```

```
        "status": "ACTIVE",

        "version": "1.0"
    }
}
```

Example unused access findings related events

The following is an example IAM Access Analyzer unused access finding event sent to EventBridge. The `id` listed is the ID for the event in EventBridge. To learn more, see Events and Event Patterns in EventBridge.

In the `detail` object, the values for the `accountId` and `region` attributes refer to the account and region reported in the finding. The `isDeleted` attribute indicates whether the event was from the finding being deleted. The `id` is the finding ID.

```
{
    "version": "0",
    "id": "dc7ce3ee-114b-3243-e249-7f10f9054b21",
    "detail-type": "Unused Access Finding for IAM entities",
    "source": "aws.access-analyzer",
    "account": "123456789012",
    "time": "2023-09-29T17:31:40Z",
    "region": "us-west-2",
    "resources": [
       "arn:aws:access-analyzer:us-west-2:123456789012:analyzer/
integTestLongLivingAnalyzer-DO-NOT-DELETE"
       ],
    "detail": {
        "findingId": "b8ae0460-5d29-4922-b92a-ba956c986277",
        "resource": "arn:aws:iam::111122223333:role/FindingIntegTestFakeRole",
        "resourceType": "AWS::IAM::Role",

        "previousStatus": "",
        "status": "ACTIVE",
        "version": "7c7a72a2-7963-4c59-ac71-f0be597010f7",
        "isDeleted": false,
        "findingType": "UnusedIAMRole",
        "error": "INTERNAL_ERROR"
        }
  }
```

Example access preview events

The following example shows data for the first event that is sent to EventBridge when you create an access preview. The `resources` array is a singleton with the ARN of the analyzer that the access preview is associated with. In the `detail` object, the `id` refers to the access preview ID and `configuredResources` refers to the resource for which the access preview was created. The `status` is `Creating` and refers to the access preview status. The `previousStatus` is not specified because the access preview was just created.

```
{
    "account": "111122223333",
    "detail": {
        "accessPreviewId": "aaaabbbb-cccc-dddd-eeee-ffffaaaabbbb",
        "configuredResources": [
            "arn:aws:s3:::amzn-s3-demo-bucket"
        ],
        "createdAt": "2020-02-20T00:00:00.00Z",
        "region": "us-west-2",
        "status": "CREATING",
        "version": "1.0"
    },
    "detail-type": "Access Preview State Change",
    "id": "aaaabbbb-2222-3333-4444-555566667777",
    "region": "us-west-2",
    "resources": [
        "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/MyAnalyzer"
    ],
    "source": "aws.access-analyzer",
    "time": "2020-02-20T00:00:00.00Z",
    "version": "0"
}
```

The following example shows data for an event that is sent to EventBridge for an access preview with a status change from `Creating` to `Completed`. In the detail object, the `id` refers to the access preview ID. The `status` and `previousStatus` refer to the access preview status, where the previous status was `Creating` and the current status is `Completed`.

```
{
    "account": "111122223333",
    "detail": {
        "accessPreviewId": "aaaabbbb-cccc-dddd-eeee-ffffaaaabbbb",
        "configuredResources": [
            "arn:aws:s3:::amzn-s3-demo-bucket"
        ],
        "createdAt": "2020-02-20T00:00:00.000Z",
        "previousStatus": "CREATING",
        "region": "us-west-2",
        "status": "COMPLETED",
        "version": "1.0"
    },
    "detail-type": "Access Preview State Change",
```

```
    "id": "11112222-3333-4444-5555-666677778888",
    "region": "us-west-2",
    "resources": [
        "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/MyAnalyzer"
    ],
    "source": "aws.access-analyzer",
    "time": "2020-02-20T00:00:00.00Z",
    "version": "0"
}
```

The following example shows data for an event that is sent to EventBridge for an access preview with a status change from `Creating` to `Failed`. In the `detail` object, the `id` refers to the access preview ID. The `status` and `previousStatus` refer to the access preview status, where the previous status was `Creating` and the current status is `Failed`. The `statusReason` field provides the reason code indicating that the access preview failed due to an invalid resource configuration.

```
{
    "account": "111122223333",
    "detail": {
        "accessPreviewId": "aaaabbbb-cccc-dddd-eeee-ffffaaaabbbb",
        "configuredResources": [
            "arn:aws:s3:::amzn-s3-demo-bucket"
        ],
        "createdAt": "2020-02-20T00:00:00.00Z",
        "previousStatus": "CREATING",
        "region": "us-west-2",
        "status": "FAILED",
        "statusReason": {
            "code": "INVALID_CONFIGURATION"
        },
        "version": "1.0"
    },
    "detail-type": "Access Preview State Change",
    "id": "99998888-7777-6666-5555-444433332222",
    "region": "us-west-2",
    "resources": [
        "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/MyAnalyzer"
    ],
    "source": "aws.access-analyzer",
    "time": "2020-02-20T00:00:00.00Z",
    "version": "0"
```

```
}
```

Creating an event rule using the console

The following procedure describes how to create an event rule using the console.

1. Open the Amazon EventBridge console at https://eusc-de-east-1.console.amazonaws-eusc.eu/events/.
2. Using the following values, create an EventBridge rule that monitors finding events or access preview events:
   - For **Rule type**, choose **Rule with an event pattern**.
   - For **Event source**, choose **Other**.
   - For **Event pattern**, choose **Custom patterns (JSON editor)**, and paste one of the following event pattern examples into the text area:
     - To create a rule based on any IAM Access Analyzer event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ]
}
```

     - To create a rule based on an external access, internal access, or unused access findings event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ],
  "detail-type": [
    "Access Analyzer Finding",
    "Internal Access Finding",
    "Unused Access Finding for IAM entities"
  ]
}
```

     - To create a rule based only on an external access findings event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ],
  "detail-type": [
    "Access Analyzer Finding"
  ]
}
```

- To create a rule based only on an internal access findings event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ],
  "detail-type": [
    "Internal Access Finding"
  ]
}
```

- To create a rule based only on an unused access findings event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ],
  "detail-type": [
    "Unused Access Finding for IAM entities"
  ]
}
```

- To create a rule based on an access preview event, use the following pattern example:

```
{
  "source": [
    "aws.access-analyzer"
  ],
  "detail-type": [
    "Access Preview State Change"
  ]
```

```
}
```

- For **Target types**, choose **AWS service**, and for **Select a target**, choose a target such as an Amazon SNS topic or AWS Lambda function. The target is triggered when an event is received that matches the event pattern defined in the rule.

To learn more about creating rules, see Creating Amazon EventBridge rules that react to events in the *Amazon EventBridge User Guide*.

Creating an event rule using the CLI

1. Use the following to create a rule for Amazon EventBridge using the AWS CLI. Replace the rule name *TestRule* with the name for your rule.

```
aws events put-rule --name TestRule --event-pattern "{\"source\":[\"aws.access-analyzer\"]}"
```

2. You can customize the rule to trigger target actions only for a subset of generated findings, such as findings with specific attributes. The following example demonstrates how to create a rule that triggers a target action only for findings with a status of Active.

```
aws events put-rule --name TestRule --event-pattern "{\"source\":[\"aws.access-analyzer\"],\"detail-type\":[\"Access Analyzer Finding\"],\"detail\":{\"status\":[\"ACTIVE\"]}}"
```

The following example demonstrates how to create a rule that triggers a target action only for access previews with a status from `Creating` to `Completed`.

```
aws events put-rule --name TestRule --event-pattern "{\"source\":[\"aws.access-analyzer\"],\"detail-type\":[\"Access Preview State Change\"],\"detail\":{\"status\":[\"COMPLETED\"]}}"
```

3. To define a Lambda function as a target for the rule you created, use the following example command. Replace the Region and the function name in the ARN as appropriate for your environment.

```
aws events put-targets --rule TestRule --targets Id=1,Arn=arn:aws:lambda:us-
east-1:111122223333:function:MyFunction
```

4. Add the permissions required to invoke the rule target. The following example demonstrates how to grant permissions to a Lambda function, following the preceding examples.

```
aws lambda add-permission --function-name MyFunction --statement-id 1 --action
 'lambda:InvokeFunction' --principal events.amazonaws.com
```

Integrate IAM Access Analyzer with AWS Security Hub CSPM

AWS Security Hub CSPM provides a comprehensive view of your security state across AWS. It helps you assess your environment against security industry standards and best practices. Security Hub CSPM collects security data from across AWS accounts, services, and supported third-party partner products. It then analyzes your security trends and identify the highest priority security issues.

When you integrate IAM Access Analyzer with Security Hub CSPM, you can send findings from IAM Access Analyzer to Security Hub CSPM. Security Hub CSPM can then include those findings in its analysis of your overall security posture.

- How to stop sending findings

How IAM Access Analyzer sends findings to Security Hub CSPM

In Security Hub CSPM, security issues are tracked as findings. Some findings come from issues that are detected by other AWS services or by third-party partners. Security Hub CSPM also has a set of rules that it uses to detect security issues and generate findings.

Security Hub CSPM provides tools to manage findings from across all of these sources. You can view and filter lists of findings and view detailed information about each finding. For more information, see Viewing findings in the *AWS Security Hub User Guide*. You can also track the status of investigations into findings. For more information, see Taking action on findings in the *AWS Security Hub User Guide*.

All findings in Security Hub CSPM use a standard JSON format called the AWS Security Finding Format (ASFF). The ASFF includes details about the source of the issue, the affected resources, and the current status of the finding. For more information, see AWS Security Finding Format (ASFF) in the *AWS Security Hub User Guide*.

AWS Identity and Access Management Access Analyzer is one of the AWS services that sends findings to Security Hub CSPM. For unused access, IAM Access Analyzer detects unused access granted to IAM users or roles and generates a finding for each of them. IAM Access Analyzer then sends these findings to Security Hub CSPM.

For external access, IAM Access Analyzer detects policy statements that allow public access or cross-account access to external principals on supported resources in your organization or account. IAM Access Analyzer generates a finding for public access and sends it to Security Hub CSPM. For cross-account access, IAM Access Analyzer sends a single finding for one external principal at a time to Security Hub CSPM. If there are multiple cross-account findings in IAM Access Analyzer, you must resolve the Security Hub CSPM finding for the single external principal before IAM Access Analyzer provides the next cross-account finding. For a full list of external principals with cross-account access outside the zone of trust for the analyzer, you must view the findings in IAM Access Analyzer. Details about the resource control policy (RCP) are available in the resource detail section.

Types of findings that IAM Access Analyzer sends

IAM Access Analyzer sends the findings to Security Hub CSPM using the AWS Security Finding Format (ASFF). In ASFF, the `Types` field provides the finding type. Findings from IAM Access Analyzer can have the following values for `Types`.

- External access findings – Effects/Data Exposure/External Access Granted

- External access findings – Software and Configuration Checks/AWS Security Best Practices/ External Access Granted
- Unused access findings – Software and Configuration Checks/AWS Security Best Practices/ Unused Permission
- Unused access findings – Software and Configuration Checks/AWS Security Best Practices/ Unused IAM Role
- Unused access findings – Software and Configuration Checks/AWS Security Best Practices/ Unused IAM User Password
- Unused access findings – Software and Configuration Checks/AWS Security Best Practices/ Unused IAM User Access Key

Latency for sending findings

When IAM Access Analyzer creates a new finding, it is usually sent to Security Hub CSPM within 30 minutes. However, there are rare cases when IAM Access Analyzer may not be notified about a policy change. For example:

- Changes to Amazon S3 account-level block public access settings can take up to 12 hours to be reflected in IAM Access Analyzer.
- Changes to a resource control policy (RCP) without a change to the resource-based policy do not trigger a rescan of the resource reported in the finding. IAM Access Analyzer analyzes the new or updated policy during the next periodic scan, which is within 24 hours.
- If there is a delivery issue with AWS CloudTrail log delivery, a policy change may not trigger a rescan of the resource that was reported in the finding.

In these situations, IAM Access Analyzer analyzes the new or updated policy during the next periodic scan.

Retrying when Security Hub CSPM is not available

If Security Hub CSPM is not available, IAM Access Analyzer retries sending the findings on a periodic basis.

Updating existing findings in Security Hub CSPM

After sending a finding to Security Hub CSPM, IAM Access Analyzer continues to send updates to reflect any additional observations of the finding activity to Security Hub CSPM. These updates are reflected within the same finding.

For external access findings IAM Access Analyzer groups them per resource. In Security Hub CSPM, the finding for a resource remains active if at least one of the findings for that resource is active in IAM Access Analyzer. If all findings in IAM Access Analyzer for a resource are archived or resolved, then the Security Hub CSPM finding is also archived. The Security Hub CSPM finding is updated when the policy access changes between public and cross-account access. This update can include changes to the type, title, description, and severity of the finding.

For unused access findings, IAM Access Analyzer does not group them by resource. Instead, if an unused access finding is resolved in IAM Access Analyzer, then the corresponding Security Hub CSPM finding is also resolved. The Security Hub CSPM finding is updated when you update the IAM user or role that generated the unused access finding.

Viewing IAM Access Analyzer findings in Security Hub CSPM

To view your IAM Access Analyzer findings in Security Hub CSPM, choose **See findings** in the **AWS: IAM Access Analyzer** section of the summary page. Alternatively, you can choose **Findings** from the navigation panel. You can then filter the findings to display only AWS Identity and Access Management Access Analyzer findings by choosing the **Product name:** field with a value of **`IAM Access Analyzer`**.

Interpreting IAM Access Analyzer finding names in Security Hub CSPM

AWS Identity and Access Management Access Analyzer sends the findings to Security Hub CSPM using the AWS Security Finding Format (ASFF). In ASFF, the **Types** field provides the finding type. ASFF types use a different naming scheme than AWS Identity and Access Management Access Analyzer. The following table includes details about all of the ASFF types associated with AWS Identity and Access Management Access Analyzer findings as they appear in Security Hub CSPM.

ASFF finding type	Security Hub CSPM finding title	Description
Effects/Data Exposure/ External Access Granted	<resource ARN> allows public access	A resource-based policy attached to the resource

ASFF finding type	Security Hub CSPM finding title	Description
		allows public access on the resource to all external principals.
Software and Configuration Checks/AWS Security Best Practices/External Access Granted	<resource ARN> allows cross-account access	A resource-based policy attached to the resource allows cross-account access to external principals outside the zone of trust for the analyzer.
Software and Configuration Checks/AWS Security Best Practices/Unused Permission	<resource ARN> contains unused permissions	A user or role contains unused service and action permissio ns.
Software and Configuration Checks/AWS Security Best Practices/Unused IAM Role	<resource ARN> contains unused IAM role	A user or role contains an unused IAM role.
Software and Configuration Checks/AWS Security Best Practices/Unused IAM User Password	<resource ARN> contains unused IAM user password	A user or role contains an unused IAM user password.
Software and Configuration Checks/AWS Security Best Practices/Unused IAM User Access Key	<resource ARN> contains unused IAM user access key	A user or role contains an unused IAM user access key.

Typical findings from IAM Access Analyzer

IAM Access Analyzer sends findings to Security Hub CSPM using the AWS Security Finding Format (ASFF).

Here is an example of a typical finding from IAM Access Analyzer for external access findings.

```
{
```

```
    "SchemaVersion": "2018-10-08",

```

Enabling and configuring the integration

To use the integration with Security Hub CSPM, you must enable Security Hub CSPM. For information on how to enable Security Hub CSPM, see Setting up Security Hub in the *AWS Security Hub User Guide*.

When you enable both IAM Access Analyzer and Security Hub CSPM, the integration is enabled automatically. IAM Access Analyzer immediately begins to send findings to Security Hub CSPM.

How to stop sending findings

To stop sending findings to Security Hub CSPM, you can use either the Security Hub CSPM console or the API.

See Disabling and enabling the flow of findings from an integration (console) or Disabling the flow of findings from an integration (Security Hub API, AWS CLI) in the *AWS Security Hub User Guide*.

Logging IAM Access Analyzer API calls with AWS CloudTrail

IAM Access Analyzer is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in IAM Access Analyzer. CloudTrail captures all API calls for IAM Access Analyzer as events. The calls captured include calls from the IAM Access Analyzer console and code calls to the IAM Access Analyzer API operations.

If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for IAM Access Analyzer. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**.

Using the information collected by CloudTrail, you can determine the request that was made to IAM Access Analyzer, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

IAM Access Analyzer information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in IAM Access Analyzer, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for IAM Access Analyzer, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations

- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All IAM Access Analyzer actions are logged by CloudTrail and are documented in the IAM Access Analyzer API Reference. For example, calls to the `CreateAnalyzer`, `CreateArchiveRule` and `ListFindings` actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity Element.

Understanding IAM Access Analyzer log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry that demonstrates the `CreateAnalyzer` operation made by an assumed-role session named `Alice-tempcreds` on "June 14, 2021". The role session was issued by the role named `admin-tempcreds`.

```
{
  "eventVersion": "1.05",

IAM Access Analyzer filter keys

You can use the filter keys below to define an archive rule (`CreateArchiveRule`), update an archive rule (`UpdateArchiveRule`), retrieve a list of findings (`ListFindings` and `ListFindingsV2`), or retrieve a list of access preview findings for a resource (`ListAccessPreviewFindings`). There is no difference between using IAM API and CloudFormation for configuring archive rules.

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
resource	**Resource**	The ARN uniquely identifying the resource that the external principal has access to. To learn more, see Amazon resource names (ARNs).	String	Yes	Yes	Yes	External Internal Unused
resourceType `AWS::S3::Bucket` | `AWS::IAM::Role` | `AWS::SQS::Queue` | `AWS::Lambda::Fun`	**Resource Type**	The type of resource that the external principal has access to. **Note** Internal access analyzers don't support all resource types that	String	Yes	Yes	Yes	External Internal Unused

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
ion | AWS::Lambda::LayerVersion |AWS::KMS::Key | AWS::SecretsManager::Secret | AWS::EFS::FileSystem | AWS::EC2::Snapshot | AWS::ECR::Repository | AWS::RDS::DBSnapshot | AWS::RDS::DBClusterSnapshot | AWS::SNS::Topic | AWS::S3		external access analyzers support. Unused access analyzers only support IAM users and roles. For more information, see IAM Access Analyzer supported resource types for external and internal access.					

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
press::I rectoryI cket | AWS::Dyı moDB::Tı le | AWS::Dyı moDB::S eam | AWS::IAI :User							
resourceO wnerAcco nt	**Resource Owner Account**	The 12 digit AWS account ID that owns the resource. To learn more, see AWS account identifiers.	String	Yes	Yes	Yes	External Internal Unused
isPublic	**Public access**	Indicates whether the finding reports a resource that has a policy that allows public access.	Boolean	Yes	Yes	Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
findingType `ExternalAccess` | `UnusedIAMRole` | `UnusedIAMUserAccessKey` | `UnusedIAMUserPassword` | `UnusedPermission` | `InternalAccess`	**Findings type**	The type of the finding. For external access analyzers, the type is `ExternalAccess`. For unused access analyzers, the type can be `UnusedIAMRole`, `UnusedIAMUserAccessKey`, `UnusedIAMUserPassword`, or `UnusedPermission`. For internal access analyzers, the type is `InternalAccess`.	String	Yes	Yes	Yes	External Internal Unused

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
resourceControlPolicyRestriction `APPLIED | APPLICABLE | FAILED_ATTACH | EVALUATION_ERROR | RCP | NOT_APPLICABLE`	**Resource control policy (RCP) restriction**	The type of restriction applied by the resource owner with an Organizations resource control policy (RCP). For more information about the values for this filter key, see ExternalAccessDetails and InternalAccessDetails in the IAM Access Analyzer API Reference.	String	Yes	Yes	Yes	External Internal
serviceControlPolicyRestriction `APPLIED | APPLICABLE | FAILED_ATTACH | EVALUATION_ERROR | SCP | NOT_APPLICABLE`	**Service control policy (SCP) restriction**	The type of restriction applied by an Organizations service control policy (SCP). For more information about the values for this filter key, see InternalAccessDetails in the IAM Access Analyzer API Reference.	String	Yes	Yes	Yes	Internal

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
status `ACTIVE` | `ARCHIVED` | `RESOLVED`	**Status**	The current status of the finding.	String	 No	 Yes	 Yes	External Internal Unused
error	**Error**	Indicates the error reported for the finding.	String	 Yes	 Yes	 Yes	External Internal
principal.AWS	**AWS Account**	The account granted access to the resource in the `Principal` field of the finding. Enter the 12-digit AWS account ID or the ARN of the external AWS user or role. To learn more, see AWS account identifiers.	String	 Yes	 Yes	 Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
principal.Federated	**Federated User**	The ARN of the federated identity that has access to the resource in the finding. To learn more, see Identity providers and federation	String	Yes	Yes	Yes	External
condition.aws:PrincipalArn	**Principal ARN**	The ARN of the principal (IAM user, role, or group) indicated as the condition for resource access. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External
condition.aws:PrincipalOrgID	**PrincipalOrgID**	The organization identifier of the principal indicated as the condition for resource access. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
condition.aws:PrincipalOrgPaths	**Principal OrgPaths**	The organization or organizational unit (OU) ID indicated as the condition for resource access. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External
condition.aws:SourceIp	**Source IP**	The IP address that allows the principal access to the resource when using the specified IP address. To learn more, see AWS global condition context keys.	IP address	Yes	Yes	Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
condition .aws:SourceVpc	**Source VPC**	The VPC ID that allows the principal access to the resource when using the specified VPC. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External
condition .aws:UserId	**User ID**	The user ID of the IAM user from an external account indicated as the condition for access to the resource. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External
condition .aws:VpceAccount	**VPCE Account**	The account ID of the VPC endpoint that allows the principal access to the resource. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External Internal

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
condition.aws:SourceVpcArn	**Source VPC Arn**	The VPC ARN that allows the principal access to the resource when using the specified VPC. To learn more, see AWS global condition context keys.	ARN	Yes	Yes	Yes	External
condition.aws:VpceOrgID	**VPCE OrgID**	The organizational ID for the VPC endpoint that allows the principal access to the resource. To learn more, see AWS global condition context keys.	String	Yes	Yes	Yes	External Internal

condition .cognito-identity.amazonaw .com:aud	**Cognito Audience**	The Amazon Cognito identity pool ID specified as a condition for IAM role access in the finding. To learn more, see IAM and AWS STS condition context keys.	String	Yes	Yes	Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
condition.graph.facebook.com:app_id	**Facebook App ID**	The Facebook application ID (or site ID) specified as a condition to allow Login with Facebook federation access to the IAM role in the finding. To learn more, see IAM and AWS STS condition context keys.	String	Yes	Yes	Yes	External
condition.accounts.google.com:aud	**Google Audience**	The Google application ID specified as a condition for access to the IAM role. To learn more, see IAM and AWS STS condition context keys.	String	Yes	Yes	Yes	External

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
condition .kms:CallerAccoun	**KMS Key ID**	The AWS account ID that owns the calling entity (IAM user, role or account root user) used by services calling AWS KMS. To learn more, see Condition keys for AWS Key Management Service.	String	Yes	Yes	Yes	External
condition .www.amazon.com:app_id	**Amazon App ID**	The Amazon application ID (or site ID) specified as a condition to allow Login with Amazon federation access to the role. To learn more, see	String	Yes	Yes	Yes	External
id	**Finding ID**	The ID of the finding.	String	No	Yes	Yes	External Internal Unused

Criterion	AWS Management Console field	Description	Type	Archive rule	List findings	List access preview findings	Supported analyzer types
changeType CHANGED | NEW | UNCHANGI		Provides context on how the access preview finding compares to existing access identified in IAM Access Analyzer.	String	No	No	Yes	External
existingFindingId		The existing ID of the finding in IAM Access Analyzer, provided only for existing findings in the access preview.	String	No	No	Yes	External
existingFindingStatus		The existing status of the finding, provided only for existing findings in the access preview.	String	No	No	Yes	External

Using service-linked roles for AWS Identity and Access Management Access Analyzer

AWS Identity and Access Management Access Analyzer uses an IAM service-linked role. A service-linked role is a unique type of IAM role linked directly to IAM Access Analyzer. Service-linked roles are predefined by IAM Access Analyzer and include all the permissions that the feature requires to call other AWS services on your behalf.

A service-linked role makes setting up IAM Access Analyzer easier because you don't have to manually add the necessary permissions. IAM Access Analyzer defines the permissions of its

service-linked roles, and unless defined otherwise, only IAM Access Analyzer can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Service-linked role permissions for AWS Identity and Access Management Access Analyzer

AWS Identity and Access Management Access Analyzer uses the service-linked role named **AWSServiceRoleForAccessAnalyzer** – Allow Access Analyzer to analyze resource metadata for external access and to analyze activity to identify unused access.

The AWSServiceRoleForAccessAnalyzer service-linked role trusts the following services to assume the role:

- `access-analyzer.amazonaws.com`

The role permissions policy named `AccessAnalyzerServiceRolePolicy` allows IAM Access Analyzer to complete actions on specific resources.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-Linked Role Permissions in the *IAM User Guide*.

Creating a service-linked role for IAM Access Analyzer

You don't need to manually create a service-linked role. When you enable Access Analyzer in the AWS Management Console or the AWS API, IAM Access Analyzer creates the service-linked role for you. The same service-linked role is used in all Regions in which you enable IAM Access Analyzer. Both external access and unused access findings use the same service-linked role.

> **Note**
>
> IAM Access Analyzer is Regional. You must enable IAM Access Analyzer in each Region independently.

If you delete this service-linked role, IAM Access Analyzer recreates the role when you next create an analyzer.

You can also use the IAM console to create a service-linked role with the **Access Analyzer** use case. In the AWS CLI or the AWS API, create a service-linked role with the `access-analyzer.amazonaws.eu` service name. For more information, see Creating a Service-Linked Role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing a service-linked role for IAM Access Analyzer

IAM Access Analyzer does not allow you to edit the AWSServiceRoleForAccessAnalyzer service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a Service-Linked Role in the *IAM User Guide*.

Deleting a service-linked role for IAM Access Analyzer

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that isn't actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

If IAM Access Analyzer is enabled in one or more regions in your AWS Organizations, you must delete all analyzers in all regions for your organization before attempting to delete this role.

> **Note**
>
> If IAM Access Analyzer is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete IAM Access Analyzer resources used by the AWSServiceRoleForAccessAnalyzer role

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the **Access reports** section, under **Access analyzer**, choose **Analyzers**.
3. Choose the analyzer from which you want to delete IAM Access Analyzer resources attached to the service-linked role.

4. Choose **Delete**.
5. To confirm that you want to delete the analyzers, enter **`delete`**, and then choose **Delete**.

To manually delete the service-linked role using IAM

Use the IAM console, the AWS CLI, or the AWS API to delete the AWSServiceRoleForAccessAnalyzer service-linked role. For more information, see Deleting a Service-Linked Role in the *IAM User Guide*.

Supported Regions for IAM Access Analyzer service-linked roles

IAM Access Analyzer supports using service-linked roles in all of the Regions where the service is available. For more information, see AWS Regions and Endpoints.

Preview access

In addition to helping you identify resources that are shared with an external entity, AWS IAM Access Analyzer also shows you a preview of IAM Access Analyzer findings before deploying resource permissions so you can validate that your policy changes grant only intended public and cross-account access to your resource. This helps you start with intended external access to your resources.

You can preview and validate public and cross-account access to your Amazon S3 buckets in the Amazon S3 console. You can also use IAM Access Analyzer APIs to preview public and cross-account access for your Amazon S3 buckets, AWS KMS keys, IAM roles, Amazon SQS queues and Secrets Manager secrets by providing proposed permissions for your resource.

Topics

- Previewing access in Amazon S3 console
- Previewing access with IAM Access Analyzer APIs

Previewing access in Amazon S3 console

After you complete your bucket policy in the Amazon S3 console you have the option to preview public and cross-account access to your Amazon S3 bucket. You can validate that your policy changes grant only intended external access before you choose **Save changes**. This optional step enables you to preview AWS Identity and Access Management Access Analyzer findings for your

bucket. You can validate whether the policy change introduces new findings or resolves existing findings for external access. You can skip this validation step and save your Amazon S3 bucket policy at any time.

To preview external access to your bucket, you must have an active account analyzer in your bucket's region with the account as the zone of trust. You must also have the permissions required to use IAM Access Analyzer and preview access. For more information on enabling IAM Access Analyzer and permissions required, see Getting started with AWS Identity and Access Management Access Analyzer.

To preview access to your Amazon S3 bucket when you create or edit your bucket policy

1. Once you finish creating or editing your bucket policy, ensure your policy is a valid Amazon S3 bucket policy. The policy ARN must match the bucket ARN and the policy elements must be valid.
2. Below the policy, under **Preview external access**, choose an active account analyzer, then choose **Preview**. A preview of IAM Access Analyzer findings is generated for your bucket. The preview analyzes the displayed Amazon S3 bucket policy, together with the existing bucket permissions. This includes the bucket and account BPA settings, bucket ACL, the Amazon S3 access points and multi-region access points attached to the bucket, and their policies and BPA settings.
3. When the access preview completes, a preview of IAM Access Analyzer findings is displayed. Each finding reports an instance of a principal outside of the account with access to your bucket after you save the policy. You can validate access to your bucket by reviewing each finding. The finding header provides a summary of the access and you can expand the finding to review the finding details. Finding badges provide context on how saving the bucket policy would change access to the bucket. For example, they help you validate whether the policy change introduces new findings or resolves existing findings for external access:

    a. **New** – indicates a finding for new external access that the policy would introduce.

    b. **Resolved** – indicates a finding for existing external access that the policy would remove.

    c. **Archived** – indicates a finding for new external access that would be automatically archived, based on the archive rules for the analyzer that define when findings should be marked as intended.

    d. **Existing** – indicates an existing finding for external access that would remain unchanged.

    e. **Public** – if a finding is for public access to the resource, it will have a **Public** badge, in addition to one of the badges above.

4. If you identify external access you do not intend to introduce or remove, you can revise the policy and then choose **Preview** again until you have achieved the external access you intend. If you have a finding labeled **Public**, we recommend you revise the policy to remove public access before you choose **Save changes**. Previewing access is an optional step and you can choose **Save changes** at any time.

Previewing access with IAM Access Analyzer APIs

You can use IAM Access Analyzer APIs to preview public and cross-account access for your Amazon S3 buckets, AWS KMS keys, IAM roles, Amazon SQS queues and Secrets Manager secrets. You can preview access by providing proposed permissions for an existing resource you own or a new resource you want to deploy.

To preview external access to your resource, you must have an active account analyzer for the account and region of the resource. You must also have the permissions required to use IAM Access Analyzer and preview access. For more information on enabling IAM Access Analyzer and permissions required, see Getting started with AWS Identity and Access Management Access Analyzer.

To preview access for a resource, you can use the `CreateAccessPreview` operation and provide the analyzer ARN and the access control configuration for the resource. The service returns the unique ID for the access preview, which you can use to check the status of the access preview with the `GetAccessPreview` operation. When the status is `Completed`, you can use the `ListAccessPreviewFindings` operation to retrieve the findings generated for the access preview. The `GetAccessPreview` and `ListAccessPreviewFindings` operations will retrieve access previews and findings created within about 24 hours.

Each finding retrieved contains finding details describing the access. A preview status of the finding describing whether the finding would be `Active`, `Archived`, or `Resolved` after permissions deployment, and a `changeType`. The `changeType` provides context on how the access preview finding compares to existing access identified in IAM Access Analyzer:

- **New** – the finding is for newly introduced access.
- **Unchanged** – the preview finding is an existing finding that would remain unchanged.
- **Changed** – the preview finding is an existing finding with a change in status.

The `status` and the `changeType` help you understand how the resource configuration would change existing resource access. If the `changeType` is `Unchanged` or `Changed`, the finding will also contain the existing ID and status of the finding in IAM Access Analyzer. For example, a `Changed` finding with preview status `Resolved` and existing status `Active` indicates the existing `Active` finding for the resource would become `Resolved` as a result of the proposed permissions change.

You can use the `ListAccessPreviews` operation to retrieve a list of access previews for the specified analyzer. This operation will retrieve information on access preview created within about one hour.

In general, if the access preview is for an existing resource and you leave a configuration option unspecified, the access preview will use the existing resource configuration by default. If the access preview is for a new resource and you leave a configuration option unspecified, the access preview will use the default value depending on the resource type. For configuration cases for each resource type, see below.

Preview access to your Amazon S3 bucket

To create an access preview for a new Amazon S3 bucket or an existing Amazon S3 bucket that you own, you can propose a bucket configuration by specifying the Amazon S3 bucket policy, bucket ACLs, bucket BPA settings, and Amazon S3 access points, including multi-region access points, attached to the bucket.

> **Note**
>
> Before attempting to create an access preview for a new bucket, we recommend you call the Amazon S3 HeadBucket operation to check whether the named bucket already exists. This operation is useful to determine if a bucket exists and you have permission to access it.

Bucket policy – If the configuration is for an existing Amazon S3 bucket and you do not specify the Amazon S3 bucket policy, the access preview uses the existing policy attached to the bucket. If the access preview is for a new resource and you do not specify the Amazon S3 bucket policy, the access preview assumes a bucket without a policy. To propose deletion of an existing bucket policy, you can specify an empty string. For more information about supported bucket policy limits, see Bucket policy examples.

Bucket ACL grants – You can propose up to 100 ACL grants per bucket. If the proposed grant configuration is for an existing bucket, the access preview uses the proposed list of grant

configurations in place of the existing grants. Otherwise, the access preview uses the existing grants for the bucket.

Bucket access points – The analysis supports up to 100 access points,including multi-region access points, per bucket, including up to ten new access points you can propose per bucket. If the proposed Amazon S3 access point configuration is for an existing bucket, the access preview uses the proposed access point configuration in place of the existing access points. To propose an access point without a policy, you can provide an empty string as the access point policy. For more information about access point policy limits, see Access points restrictions and limitations.

Block public access configuration – If the proposed configuration is for an existing Amazon S3 bucket and you do not specify the configuration, the access preview uses the existing setting. If the proposed configuration is for a new bucket and you do not specify the bucket BPA configuration, the access preview uses `false`. If the proposed configuration is for a new access point or multi-region access point, and you do not specify the access point BPA configuration, the access preview uses `true`.

Preview access to your AWS KMS key

To create an access preview for a new AWS KMS key or an existing AWS KMS key that you own, you can propose a AWS KMS key configuration by specifying the key policy and the AWS KMS grant configuration.

AWS KMS key policy – If the configuration is for an existing key and you do not specify the key policy, the access preview uses the existing policy for the key. If the access preview is for a new resource and you do not specify the key policy, then the access preview uses the default key policy. The proposed key policy cannot be an empty string.

AWS KMS grants – The analysis supports up to 100 KMS grants per configuration*.* If the proposed grant configuration is for an existing key, the access preview uses the proposed list of grant configurations in place of the existing grants. Otherwise, the access preview uses the existing grants for the key.

Preview access to your IAM role

To create an access preview for a new IAM role or an existing IAM role that you own, you can propose an IAM role configuration by specifying the trust policy.

Role trust policy – If the configuration is for a new IAM role, you must specify the trust policy. If the configuration is for an existing IAM role that you own and you do not propose the trust policy,

the access preview uses the existing trust policy for the role. The proposed trust policy cannot be an empty string.

Preview access to your Amazon SQS queue

To create an access preview for a new Amazon SQS queue or an existing Amazon SQS queue that you own, you can propose an Amazon SQS queue configuration by specifying the Amazon SQS policy for the queue.

Amazon SQS queue policy – If the configuration is for an existing Amazon SQS queue and you do not specify the Amazon SQS policy, the access preview uses the existing Amazon SQS policy for the queue. If the access preview is for a new resource and you do not specify the policy, the access preview assumes an Amazon SQS queue without a policy. To propose deletion of an existing Amazon SQS queue policy, you can specify an empty string for the Amazon SQS policy.

Preview access to your Secrets Manager secret

To create an access preview for a new Secrets Manager secret or an existing Secrets Manager secret that you own, you can propose a Secrets Manager secret configuration by specifying the secret policy and optional AWS KMS encryption key.

Secret policy – If the configuration is for an existing secret and you do not specify the secret policy, the access preview uses the existing policy for the secret. If the access preview is for a new resource and you do not specify the policy, the access preview assumes a secret without a policy. To propose deletion of an existing policy, you can specify an empty string.

AWS KMS encryption key – If the proposed configuration is for a new secret and you do not specify the AWS KMS key ID, the access preview uses the default KMS key of the AWS account. If you specify an empty string for the AWS KMS key ID, the access preview uses the default KMS key of the AWS account.

Checks for validating policies

IAM Access Analyzer provides policy checks that help validate your IAM policies before you attach them to an entity. These include basic policy checks provided by policy validation to validate your policy against policy grammar and AWS best practices. You can view policy validation check findings that include security warnings, errors, general warnings, and suggestions for your policy.

You can use custom policy checks to check for new access based on your security standards. A charge is associated with each check for new access. For more details about pricing, see IAM Access Analyzer pricing.

How custom policy checks work

You can validate your policies against your specified security standards using AWS Identity and Access Management Access Analyzer custom policy checks. You can run the following types of custom policy checks:

- **Check against a reference policy**: When editing a policy, you can check whether the updated policy grants new access compared to a reference policy, such as an existing version of the policy. You can run this check when you edit a policy using the AWS Command Line Interface (AWS CLI), IAM Access Analyzer API (API), or JSON policy editor in the IAM console.

  > **Note**
  >
  > IAM Access Analyzer custom policy checks allow wildcards in the `Principal` element for reference resource policies.

- **Check against a list of IAM actions or resources**: You can check to ensure that specific IAM actions or resources are not allowed by your policy. If only actions are specified, IAM Access Analyzer checks for access of the actions on all resources in the policy. If only resources are specified, then IAM Access Analyzer checks which actions have access to the specified resources. If both actions and resources are specified, then IAM Access Analyzer checks which of the specified actions have access to the specified resources. You can run this check when you create or edit a policy using the AWS CLI or the API.
- **Check for public access**: You can check whether a resource policy can grant public access to a specified resource type. You can run this check when you create or edit a policy using the AWS CLI or the API. This type of custom policy check differs from previewing access because the check doesn't require any account or external access analyzer context. Access previews allow you to preview IAM Access Analyzer findings before deploying resource permissions, while the custom check determines whether public access might be granted by a policy.

A charge is associated with each custom policy check. For more details about pricing, see IAM Access Analyzer pricing.

You can run custom policy checks on identity and resource-based policies. Custom policy checks don't rely on pattern-matching techniques or examining access logs to determine whether new or a specified access is allowed by a policy. Similar to external access findings, custom policy checks are built on Zelkova. Zelkova translates IAM policies into equivalent logical statements, and runs a suite of general-purpose and specialized logical solvers (satisfiability modulo theories) against the problem. To check for new or specified access, IAM Access Analyzer applies Zelkova repeatedly to a policy. Queries become increasingly specific to characterize classes of behaviors that the policy allows based on the content of the policy. For more information about satisfiability modulo theories, see Satisfiability Modulo Theories.

In rare cases, IAM Access Analyzer isn't able to fully determine whether a policy statement grants new or specified access. In those cases, it errs on the side of declaring a false positive by failing the custom policy check. IAM Access Analyzer is designed to provide a comprehensive policy evaluation and strives to minimize false negatives. This approach means that IAM Access Analyzer provides a high degree of assurance that a passed check means access wasn't granted by the policy. You can inspect failed checks manually by reviewing the policy statement that's reported in the response from IAM Access Analyzer.

Examples of reference policies to check for new access

You can find examples for reference policies and learn how to set up and run a custom policy check for new access in the IAM Access Analyzer custom policy checks samples repository on GitHub.

Before using these examples

Before you use these sample reference policies, do the following:

- Carefully review and customize the reference policies for your unique requirements.
