Welcome to the Identity Store API Reference

Note

IAM Identity Center uses the sso, sso-directory, and identitystore API namespaces. The sso-directory and identitystore namespaces authorize access to data in the Identity Store. Make sure your policies with IAM actions from these two namespaces are consistent to avoid conflicting authorization to the same data.

The identity store service used by AWS IAM Identity Center provides a single place to retrieve all of your identities (users and groups). You can use the identity store API operations in this guide to manage your identity data programmatically. The scope of these APIs allows you to create, read, update, delete, and list users, groups, and memberships.

This guide also describes identity store operations that you can call and includes detailed information about data types and errors.

If you use an external identity provider or Active Directory as your identity source, we recommend that you use the Create, Update, and Delete APIs with caution. Because IAM Identity Center doesn't support outbound synchronization, your identity source won't automatically update with the changes that you make to users or groups using these APIs.

AWS provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, iOS, Android, and more). The SDKs provide a convenient way to programmatically access Directory Service and other AWS services. For more information about the AWS SDKs, including how to download and install them, see Tools for Amazon Web Services.

The following data is returned in JSON format by the service.

GroupId

The identifier of the newly created group in the identity store.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 47.

Pattern: $([0-9a-f]\{10\}-|)[A-Fa-f0-9]\{8\}-[A-Fa-f0-9]\{4\}-[A-Fa-f0-9]\{4\}-[A-Fa-f0-9]\{12\}$

IdentityStoreId

The globally unique identifier for the identity store.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 36.

Response Syntax 4

Pattern: $d-[0-9a-f]\{10\}$ $^[0-9a-f]\{8\}-[0-9a-f]\{4\}-[0-9a-f]\{4\}-[0-9a-f]\{4\}-[0-9a-f]\{4\}-[0-9a-f]\{12\}$

Errors

For information about the errors that are common to all actions, see Common Errors.

AccessDeniedException

You do not have sufficient access to perform this action.

Reason

Indicates the reason for an access denial when returned by KMS while accessing a Customer Managed KMS key. For non-KMS access-denied errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

ConflictException

This request cannot be completed for one of the following reasons:

- Performing the requested operation would violate an existing uniqueness claim in the identity store. Resolve the conflict before retrying this request.
- The requested resource was being concurrently modified by another request.

Reason

Indicates the reason for a conflict error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

InternalServerException

The request processing has failed because of an unknown error, exception or failure with an internal server.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

RetryAfterSeconds

The number of seconds to wait before retrying the next request.

HTTP Status Code: 500

ResourceNotFoundException

Indicates that a requested resource is not found.

Reason

Indicates the reason for a resource not found error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

Resourceld

The identifier for a resource in the identity store that can be used as UserId or GroupId. The format for ResourceId is either UUID or 1234567890-UUID, where UUID is a randomly generated value for each resource when it is created and 1234567890 represents the IdentityStoreId string value. In the case that the identity store is migrated from a legacy SSO identity store, the ResourceId for that identity store will be in the format of UUID. Otherwise, it will be in the 1234567890-UUID format.

ResourceType

An enum object indicating the type of resource in the identity store service. Valid values include USER, GROUP, and IDENTITY_STORE.

HTTP Status Code: 400

ServiceQuotaExceededException

The request would cause the number of users or groups in the identity store to exceed the maximum allowed.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

ThrottlingException

Indicates that the principal has crossed the throttling limits of the API operations.

Reason

Indicates the reason for the throttling error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

RetryAfterSeconds

The number of seconds to wait before retrying the next request.

HTTP Status Code: 400

ValidationException

The request failed because it contains a syntax error.

Reason

Indicates the reason for the validation error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

Examples

Errors

For information about the errors that are common to all actions, see Common Errors.

AccessDeniedException

You do not have sufficient access to perform this action.

Reason

Indicates the reason for an access denial when returned by KMS while accessing a Customer Managed KMS key. For non-KMS access-denied errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

InternalServerException

The request processing has failed because of an unknown error, exception or failure with an internal server.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

RetryAfterSeconds

The number of seconds to wait before retrying the next request.

HTTP Status Code: 500

ResourceNotFoundException

Indicates that a requested resource is not found.

Errors 55

Reason

Indicates the reason for a resource not found error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

Resourceld

The identifier for a resource in the identity store that can be used as UserId or GroupId. The format for ResourceId is either UUID or 1234567890-UUID, where UUID is a randomly generated value for each resource when it is created and 1234567890 represents the IdentityStoreId string value. In the case that the identity store is migrated from a legacy SSO identity store, the ResourceId for that identity store will be in the format of UUID. Otherwise, it will be in the 1234567890-UUID format.

ResourceType

An enum object indicating the type of resource in the identity store service. Valid values include USER, GROUP, and IDENTITY_STORE.

HTTP Status Code: 400

ThrottlingException

Indicates that the principal has crossed the throttling limits of the API operations.

Reason

Indicates the reason for the throttling error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

InternalServerException

The request processing has failed because of an unknown error, exception or failure with an internal server.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

The following data is returned in JSON format by the service.

NextToken

The pagination token used for the ListUsers and ListGroups API operations. This value is generated by the identity store service. It is returned in the API response if the total results are more than the size of one page. This token is also returned when it is used in the API request to search for the next page.

HTTP Status Code: 400

InternalServerException

The request processing has failed because of an unknown error, exception or failure with an internal server.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see **Common Errors**.

AccessDeniedException

Reason

Indicates the reason for an access denial when returned by KMS while accessing a Customer Managed KMS key. For non-KMS access-denied errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

Response Elements 136

ConflictException

This request cannot be completed for one of the following reasons:

 Performing the requested operation would violate an existing uniqueness claim in the identity store. Resolve the conflict before retrying this request.

• The requested resource was being concurrently modified by another request.

Reason

Indicates the reason for a conflict error when the service is unable to access a Customer Managed KMS key. For non-KMS permission errors, this field is not included.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

The format for ResourceId is either UUID or 1234567890-UUID, where UUID is a randomly generated value for each resource when it is created and 1234567890 represents the IdentityStoreId string value. In the case that the identity store is migrated from a legacy SSO identity store, the ResourceId for that identity store will be in the format of UUID. Otherwise, it will be in the 1234567890-UUID format.

ResourceType

An enum object indicating the type of resource in the identity store service. Valid values include USER, GROUP, and IDENTITY_STORE.

HTTP Status Code: 400

ServiceQuotaExceededException

The request would cause the number of users or groups in the identity store to exceed the maximum allowed.

RequestId

The identifier for each request. This value is a globally unique ID that is generated by the identity store service for each sent request, and is then returned inside the exception if the request fails.

HTTP Status Code: 400

ThrottlingException

Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see <u>Signing AWS API requests</u> in the *IAM User Guide*.

Action

The action to be performed.

Type: string

Required: Yes

Version

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

X-Amz-Algorithm

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: AWS4-HMAC-SHA256

Required: Conditional

X-Amz-Credential

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4_request"). The value is expressed in the following format: access_key/YYYYMMDD/region/service/aws4_request.

For more information, see Create a signed AWS API request in the IAM User Guide.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-Date

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Elements of an AWS API request signature in the *IAM User Guide*.

Type: string

Required: Conditional

X-Amz-Security-Token

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see AWS services that work with IAM in the IAM User Guide.

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string

Required: Conditional

X-Amz-Signature

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

X-Amz-SignedHeaders

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see <u>Create a signed AWS API request</u> in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional
