Welcome to the AWS Systems Manager SDK Getting Started scenario.
This program demonstrates how to interact with Systems Manager using the AWS SDK
 for Python (Boto3).
Systems Manager is the operations hub for your AWS applications and resources and
 a secure end-to-end management
solution. The program's primary functions include creating a maintenance window,
 creating a document, sending a
command to a document, listing documents, listing commands, creating an OpsItem,
 modifying an OpsItem, and deleting
Systems Manager resources. Upon completion of the program, all AWS resources are
 cleaned up.
Let's get started..."""

Actions for Systems Manager using AWS SDKs

The following code examples demonstrate how to perform individual Systems Manager actions with AWS SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the AWS Systems Manager API Reference.

Examples

- Use AddTagsToResource with a CLI
- Use CancelCommand with a CLI
- Use CreateActivation with a CLI
- Use CreateAssociation with a CLI
- Use CreateAssociationBatch with a CLI
- Use CreateDocument with an AWS SDK or CLI
- Use CreateMaintenanceWindow with an AWS SDK or CLI
- Use CreateOpsItem with an AWS SDK or CLI
- Use CreatePatchBaseline with a CLI
- Use DeleteActivation with a CLI
- Use DeleteAssociation with a CLI
- Use DeleteDocument with an AWS SDK or CLI
- Use DeleteMaintenanceWindow with an AWS SDK or CLI
- Use DeleteOpsItem with an AWS SDK
- Use DeleteParameter with a CLI
- Use DeletePatchBaseline with a CLI
- Use DeregisterManagedInstance with a CLI
- Use DeregisterPatchBaselineForPatchGroup with a CLI
- Use DeregisterTargetFromMaintenanceWindow with a CLI
- Use DeregisterTaskFromMaintenanceWindow with a CLI
- Use DescribeActivations with a CLI
- Use DescribeAssociation with a CLI
- Use DescribeAssociationExecutionTargets with a CLI
- Use DescribeAssociationExecutions with a CLI
- Use DescribeAutomationExecutions with a CLI
- Use DescribeAutomationStepExecutions with a CLI
- Use DescribeAvailablePatches with a CLI

- Use DescribeDocument with a CLI
- Use DescribeDocumentPermission with a CLI
- Use DescribeEffectiveInstanceAssociations with a CLI
- Use DescribeEffectivePatchesForPatchBaseline with a CLI
- Use DescribeInstanceAssociationsStatus with a CLI
- Use DescribeInstanceInformation with a CLI
- Use DescribeInstancePatchStates with a CLI
- Use DescribeInstancePatchStatesForPatchGroup with a CLI
- Use DescribeInstancePatches with a CLI
- Use DescribeMaintenanceWindowExecutionTaskInvocations with a CLI
- Use DescribeMaintenanceWindowExecutionTasks with a CLI
- Use DescribeMaintenanceWindowExecutions with a CLI
- Use DescribeMaintenanceWindowTargets with a CLI
- Use DescribeMaintenanceWindowTasks with a CLI
- Use DescribeMaintenanceWindows with a CLI
- Use DescribeOpsItems with an AWS SDK or CLI
- Use DescribeParameters with an AWS SDK or CLI
- Use DescribePatchBaselines with a CLI

Use `AddTagsToResource` with a CLI

The following code examples show how to use `AddTagsToResource`.

CLI

AWS CLI

Example 1: To add tags to a maintenance window

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
    --resource-type "MaintenanceWindow" \
    --resource-id "mw-03eb9db428EXAMPLE" \
    --tags "Key=Stack,Value=Production"
```

This command produces no output.

Example 2: To add tags to a parameter

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \
    --resource-type "Parameter" \
    --resource-id "My-Parameter" \
    --tags '[{"Key":"Region","Value":"East"},{"Key":"Environment",
 "Value":"Production"}]'
```

This command produces no output.

Example 3: To add tags to an SSM document

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \
    --resource-type "Document" \
    --resource-id "My-Document" \
    --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see Tagging Systems Manager resources in the *AWS Systems Manager User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates a maintenance window with new tags. There is no output if the command succeeds. The syntax used by this example requires PowerShell version 3 or later.

```
$option1 = @{Key="Stack";Value=@("Production")}
Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $option1
```

Example 2: With PowerShell version 2, you must use New-Object to create each tag. There is no output if the command succeeds.

```
$tag1 = New-Object Amazon.SimpleSystemsManagement.Model.Tag
$tag1.Key = "Stack"
$tag1.Value = "Production"

Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $tag1
```

- For API details, see AddTagsToResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates a maintenance window with new tags. There is no output if the command succeeds. The syntax used by this example requires PowerShell version 3 or later.

```
$option1 = @{Key="Stack";Value=@("Production")}
Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $option1
```

Example 2: With PowerShell version 2, you must use New-Object to create each tag. There is no output if the command succeeds.

```
$tag1 = New-Object Amazon.SimpleSystemsManagement.Model.Tag
$tag1.Key = "Stack"
$tag1.Value = "Production"

Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $tag1
```

- For API details, see AddTagsToResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CancelCommand` with a CLI

The following code examples show how to use `CancelCommand`.

CLI

AWS CLI

Example 1: To cancel a command for all instances

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

This command produces no output.

Example 2: To cancel a command for specific instances

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
    --instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see Tagging Systems Manager Parameters in the *AWS Systems Manager User Guide*.

- For API details, see CancelCommand in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attempts to cancel a command. There is no output if the operation succeeds.

```
Stop-SSMCommand -CommandId "9ded293e-e792-4440-8e3e-7b8ec5feaa38"
```

- For API details, see CancelCommand in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attempts to cancel a command. There is no output if the operation succeeds.

```
Stop-SSMCommand -CommandId "9ded293e-e792-4440-8e3e-7b8ec5feaa38"
```

- For API details, see CancelCommand in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateActivation` with a CLI

The following code examples show how to use `CreateActivation`.

CLI

AWS CLI

To create a managed instance activation

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see CreateActivation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a managed instance.

```
New-SSMActivation -DefaultInstanceName "MyWebServers" -IamRole
 "SSMAutomationRole" -RegistrationLimit 10
```

Output:

```
ActivationCode       ActivationId
--------------       ------------
```

```
KWChhOxBTiwDcKE9BlKC 08e51e79-1e36-446c-8e63-9458569c1363
```

- For API details, see CreateActivation in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a managed instance.

```
New-SSMActivation -DefaultInstanceName "MyWebServers" -IamRole
 "SSMAutomationRole" -RegistrationLimit 10
```

Output:

```
ActivationCode       ActivationId
--------------       ------------
KWChhOxBTiwDcKE9BlKC 08e51e79-1e36-446c-8e63-9458569c1363
```

- For API details, see CreateActivation in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAssociation` with a CLI

The following code examples show how to use `CreateAssociation`.

CLI

AWS CLI

Example 1: To associate a document using instance IDs

This example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
    --instance-id "i-0cb2b964d3e14fd9f" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
```

```
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference*.

Example 2: To associate a document using targets

This example associates a configuration document with an instance, using targets.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
```

```
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference*.

Example 3: To create an association that runs only once

This example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "at(2020-05-14T15:55:00)"  \
    --apply-only-at-cron-interval
```

Output:

```
{
    "AssociationDescription": {
```

```
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference* or Reference: Cron and rate expressions for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see CreateAssociation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example associates a configuration document with an instance, using instance IDs.

```
New-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ffd8c57862

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAssociationBatch` with a CLI

The following code examples show how to use `CreateAssociationBatch`.

CLI

AWS CLI

To create multiple associations

This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

Command:

```
aws ssm create-association-batch --entries "Name=AWS-
UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
  "Successful": [
      {
          "Name": "AWS-UpdateSSMAgent",
          "InstanceId": "i-1234567890abcdef0",
          "AssociationVersion": "1",
          "Date": 1550504725.007,
          "LastUpdateAssociationDate": 1550504725.007,
          "Status": {
              "Date": 1550504725.007,
              "Name": "Associated",
              "Message": "Associated with AWS-UpdateSSMAgent"
          },
          "Overview": {
              "Status": "Pending",
              "DetailedStatus": "Creating"
          },
          "DocumentVersion": "$DEFAULT",
          "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
          "Targets": [
              {
                  "Key": "InstanceIds",
                  "Values": [
                      "i-1234567890abcdef0"
                  ]
              }
```

```
            ]
        },
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",

PowerShell

Tools for PowerShell V4

Example 1: This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

```
$option1 = @{InstanceId="i-0cb2b964d3e14fd9f";Name=@("AWS-UpdateSSMAgent")}
$option2 = @{InstanceId="i-0000293ffd8c57862";Name=@("AWS-UpdateSSMAgent")}
```

```
New-SSMAssociationFromBatch -Entry $option1,$option2
```

Output:

```
Failed  Successful
------  ----------
{}      {Amazon.SimpleSystemsManagement.Model.FailedCreateAssociation,
 Amazon.SimpleSystemsManagement.Model.FailedCreateAsso...
```

Example 2: This example will show the full details of a successful operation.

```
$option1 = @{InstanceId="i-0cb2b964d3e14fd9f";Name=@("AWS-UpdateSSMAgent")}
$option2 = @{InstanceId="i-0000293ffd8c57862";Name=@("AWS-UpdateSSMAgent")}
(New-SSMAssociationFromBatch -Entry $option1,$option2).Successful
```

- For API details, see CreateAssociationBatch in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

```
$option1 = @{InstanceId="i-0cb2b964d3e14fd9f";Name=@("AWS-UpdateSSMAgent")}
$option2 = @{InstanceId="i-0000293ffd8c57862";Name=@("AWS-UpdateSSMAgent")}
New-SSMAssociationFromBatch -Entry $option1,$option2
```

Output:

```
Failed  Successful
------  ----------
{}      {Amazon.SimpleSystemsManagement.Model.FailedCreateAssociation,
 Amazon.SimpleSystemsManagement.Model.FailedCreateAsso...
```

Example 2: This example will show the full details of a successful operation.

```
$option1 = @{InstanceId="i-0cb2b964d3e14fd9f";Name=@("AWS-UpdateSSMAgent")}
$option2 = @{InstanceId="i-0000293ffd8c57862";Name=@("AWS-UpdateSSMAgent")}
(New-SSMAssociationFromBatch -Entry $option1,$option2).Successful
```

- For API details, see CreateAssociationBatch in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Use `CreateMaintenanceWindow` with an AWS SDK or CLI

The following code examples show how to use `CreateMaintenanceWindow`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
    --schedule "rate(5 minutes)" \
    --duration 2 --cutoff 1 \
```

```
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
}
```

For more information, see Maintenance Windows in the *AWS Systems Manager User Guide*.

- For API details, see CreateMaintenanceWindow in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

Use `CreateOpsItem` with an AWS SDK or CLI

The following code examples show how to use `CreateOpsItem`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To create an OpsItems

The following `create-ops-item` example uses the /aws/resources key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
    --title "EC2 instance disk full" \
    --description "Log clean up may have failed which caused the disk to be full"
 \
    --priority 2 \
    --source ec2 \
    --operational-data '{"/aws/resources":{"Value":"[{\"arn
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems
\"}]","Type":"SearchableString"}}' \
    --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{
    "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see Creating OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see CreateOpsItem in *AWS CLI Command Reference*.

Java

Use `CreatePatchBaseline` with a CLI

The following code examples show how to use `CreatePatchBaseline`.

CLI

AWS CLI

Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,1
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},App
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
```

```
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,1
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},App
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
    --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
    "Name": "Amazon-Linux-2017.09-Production-Baseline",
    "Description": "My approval rules patch baseline for Amazon Linux 2017.09
 instances",
    "OperatingSystem": "AMAZON_LINUX",
```

```
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ],
    "ApprovalRules": {
        "PatchRules": [
            {
                "ApproveAfterDays": 7,
                "EnableNonSecurity": true,
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "SEVERITY",
                            "Values": [
                                "Important",
                                "Critical"
                            ]
                        },
                        {
                            "Key": "CLASSIFICATION",
                            "Values": [
                                "Security",
                                "Bugfix"
                            ]
                        },
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "AmazonLinux2017.09"
                            ]
                        }
                    ]
                }
            }
        ]
    },
    "Sources": [
        {
            "Name": "My-AL2017.09",
            "Products": [
                "AmazonLinux2017.09"
            ],
```

```
            "Configuration": "[amzn-main] \nname=amzn-main-Base
\nmirrorlist=http://repo./$awsregion./$awsdomain//$releasever/main/
mirror.list //nmirrorlist_expire=300//nmetadata_expire=300 \npriority=10
 \nfailovermethod=priority \nfastestmirror_enabled=0 \ngpgcheck=1
 \ngpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-amazon-ga \nenabled=1 \nretries=3
 \ntimeout=5\nreport_instanceid=yes"
        }
    ]
}
```

Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```
aws ssm create-patch-baseline \
    --name "Amazon-Linux-2017.09-Alpha-Baseline" \
    --description "My custom approve/reject patch baseline for Amazon Linux
 2017.09 instances" \
    --operating-system "AMAZON_LINUX" \
    --approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \
    --approved-patches-compliance-level "HIGH" \
    --approved-patches-enable-non-security \
    --tags "Key=Environment,Value=Alpha"
```

For more information, see Create a Custom Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see CreatePatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a patch baseline that approves patches, seven days after they are released by Microsoft, for managed instances running Windows Server 2019 in a production environment.

```
$rule = New-Object Amazon.SimpleSystemsManagement.Model.PatchRule
$rule.ApproveAfterDays = 7
```

```
$ruleFilters = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilterGroup

$patchFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter
$patchFilter.Key="PRODUCT"
$patchFilter.Values="WindowsServer2019"

$severityFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter
$severityFilter.Key="MSRC_SEVERITY"
$severityFilter.Values.Add("Critical")
$severityFilter.Values.Add("Important")
$severityFilter.Values.Add("Moderate")

$classificationFilter = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchFilter
$classificationFilter.Key = "CLASSIFICATION"
$classificationFilter.Values.Add( "SecurityUpdates" )
$classificationFilter.Values.Add( "Updates" )
$classificationFilter.Values.Add( "UpdateRollups" )
$classificationFilter.Values.Add( "CriticalUpdates" )

$ruleFilters.PatchFilters.Add($severityFilter)
$ruleFilters.PatchFilters.Add($classificationFilter)
$ruleFilters.PatchFilters.Add($patchFilter)
$rule.PatchFilterGroup = $ruleFilters

New-SSMPatchBaseline -Name "Production-Baseline-Windows2019" -Description
 "Baseline containing all updates approved for production systems" -
ApprovalRules_PatchRule $rule
```

Output:

```
pb-0z4z6221c4296b23z
```

- For API details, see CreatePatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a patch baseline that approves patches, seven days after they are released by Microsoft, for managed instances running Windows Server 2019 in a production environment.

```
$rule = New-Object Amazon.SimpleSystemsManagement.Model.PatchRule
```

```
$rule.ApproveAfterDays = 7

$ruleFilters = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilterGroup

$patchFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter
$patchFilter.Key="PRODUCT"
$patchFilter.Values="WindowsServer2019"

$severityFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter

Use `DeleteActivation` with a CLI

The following code examples show how to use `DeleteActivation`.

CLI

AWS CLI

To delete a managed instance activation

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \
    --activation-id "aa673477-d926-42c1-8757-1358cEXAMPLE"
```

This command produces no output.

For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.

- For API details, see DeleteActivation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes an activation. There is no output if the command succeeds.

```
Remove-SSMActivation -ActivationId "08e51e79-1e36-446c-8e63-9458569c1363"
```

- For API details, see DeleteActivation in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes an activation. There is no output if the command succeeds.

```
Remove-SSMActivation -ActivationId "08e51e79-1e36-446c-8e63-9458569c1363"
```

- For API details, see DeleteActivation in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAssociation` with a CLI

The following code examples show how to use `DeleteAssociation`.

CLI

AWS CLI

Example 1: To delete an association using the association ID

The following `delete-association` example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To delete an association

The following `delete-association` example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DeleteAssociation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the association between an instance and a document. There is no output if the command succeeds.

```
Remove-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-
UpdateSSMAgent"
```

- For API details, see DeleteAssociation in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the association between an instance and a document. There is no output if the command succeeds.

```
Remove-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-
UpdateSSMAgent"
```

- For API details, see DeleteAssociation in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteDocument` with an AWS SDK or CLI

The following code examples show how to use `DeleteDocument`.

CLI

AWS CLI

To delete a document

The following `delete-document` example deletes a Systems Manager document.

```
aws ssm delete-document \
    --name "Example"
```

This command produces no output.

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DeleteDocument in *AWS CLI Command Reference*.

Use `DeleteMaintenanceWindow` with an AWS SDK or CLI

The following code examples show how to use `DeleteMaintenanceWindow`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To delete a maintenance window

This `delete-maintenance-window` example removes the specified maintenance window.

```
aws ssm delete-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```
{
    "WindowId":"mw-1a2b3c4d5e6f7g8h9"
}
```

For more information, see Delete a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeleteMaintenanceWindow in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /**
    * Deletes an AWS SSM Maintenance Window asynchronously.
    *
    * @param winId The ID of the Maintenance Window to delete.
    * <p>
    * This method initiates an asynchronous request to delete an SSM Maintenance
Window.
    * If an exception occurs, it handles the error appropriately.
    */

Use `DeleteOpsItem` with an AWS SDK

The following code example shows how to use `DeleteOpsItem`.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class OpsItemWrapper:
    """Encapsulates AWS Systems Manager OpsItem actions."""

    def __init__(self, ssm_client):
        """
        :param ssm_client: A Boto3 Systems Manager client.
        """
        self.ssm_client = ssm_client
        self.id = None

    @classmethod
    def from_client(cls):
```

```
        """
        :return: A OpsItemWrapper instance.
        """
        ssm_client = boto3.client("ssm")
        return cls(ssm_client)

    def delete(self):
        """
        Delete the OpsItem.
        """
        if self.id is None:
            return
        try:
            self.ssm_client.delete_ops_item(OpsItemId=self.id)
            print(f"Deleted ops item with id {self.id}")
            self.id = None
        except ClientError as err:
            logger.error(
                "Couldn't delete ops item %s. Here's why: %s: %s",
                self.id,
                err.response["Error"]["Code"],
                err.response["Error"]["Message"],
            )
            raise
```

- For API details, see DeleteOpsItem in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteParameter` with a CLI

The following code examples show how to use `DeleteParameter`.

CLI

AWS CLI

To delete a parameter

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \
    --name "MyParameter"
```

This command produces no output.

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

- For API details, see DeleteParameter in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes a parameter. There is no output if the command succeeds.

```
Remove-SSMParameter -Name "helloWorld"
```

- For API details, see DeleteParameter in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes a parameter. There is no output if the command succeeds.

```
Remove-SSMParameter -Name "helloWorld"
```

- For API details, see DeleteParameter in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeletePatchBaseline` with a CLI

The following code examples show how to use `DeletePatchBaseline`.

CLI

AWS CLI

To delete a patch baseline

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \
    --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see Update or Delete a Patch Baseline (Console) in the *AWS Systems Manager User Guide*.

- For API details, see DeletePatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes a patch baseline.

```
Remove-SSMPatchBaseline -BaselineId "pb-045f10b4f382baeda"
```

Output:

```
pb-045f10b4f382baeda
```

- For API details, see DeletePatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes a patch baseline.

```
Remove-SSMPatchBaseline -BaselineId "pb-045f10b4f382baeda"
```

Output:

```
pb-045f10b4f382baeda
```

- For API details, see DeletePatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterManagedInstance` with a CLI

The following code examples show how to use `DeregisterManagedInstance`.

CLI

AWS CLI

To deregister a managed instance

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance \
    --instance-id 'mi-08ab247cdfEXAMPLE'
```

This command produces no output.

For more information, see Deregistering managed nodes in a hybrid and multicloud environment in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterManagedInstance in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deregisters a managed instance. There is no output if the command succeeds.

```
Unregister-SSMManagedInstance -InstanceId "mi-08ab247cdf1046573"
```

- For API details, see DeregisterManagedInstance in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deregisters a managed instance. There is no output if the command succeeds.

```
Unregister-SSMManagedInstance -InstanceId "mi-08ab247cdf1046573"
```

- For API details, see DeregisterManagedInstance in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `DeregisterPatchBaselineForPatchGroup`.

CLI

AWS CLI

To deregister a patch group from a patch baseline

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \
    --patch-group "Production" \
    --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{
  "PatchGroup":"Production",
  "BaselineId":"pb-0ca44a362fEXAMPLE"
```

```
}
```

For more information, see Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deregisters a patch group from a patch baseline.

```
Unregister-SSMPatchBaselineForPatchGroup -BaselineId "pb-045f10b4f382baeda" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see DeregisterPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deregisters a patch group from a patch baseline.

```
Unregister-SSMPatchBaselineForPatchGroup -BaselineId "pb-045f10b4f382baeda" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see DeregisterPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterTargetFromMaintenanceWindow` with a CLI

The following code examples show how to use `DeregisterTargetFromMaintenanceWindow`.

CLI

AWS CLI

To remove a target from a maintenance window

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
    "WindowId":"mw-ab12cd34ef56gh78",
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTargetFromMaintenanceWindow in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a target from a maintenance window.

```
Unregister-SSMTargetFromMaintenanceWindow -WindowTargetId
 "6ab5c208-9fc4-4697-84b7-b02a6cc25f7d" -WindowId "mw-06cf17cbefcb4bf4f"
```

Output:

```
WindowId             WindowTargetId
--------             --------------
mw-06cf17cbefcb4bf4f 6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

- For API details, see DeregisterTargetFromMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a target from a maintenance window.

```
Unregister-SSMTargetFromMaintenanceWindow -WindowTargetId
 "6ab5c208-9fc4-4697-84b7-b02a6cc25f7d" -WindowId "mw-06cf17cbefcb4bf4f"
```

Output:

```
WindowId             WindowTargetId
--------             --------------
mw-06cf17cbefcb4bf4f 6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

- For API details, see DeregisterTargetFromMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterTaskFromMaintenanceWindow` with a CLI

The following code examples show how to use `DeregisterTaskFromMaintenanceWindow`.

CLI

AWS CLI

To remove a task from a maintenance window

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-task-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c"
```

Output:

```
{
    "WindowTaskId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c",
    "WindowId":"mw-ab12cd34ef56gh78"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTaskFromMaintenanceWindow in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a task from a maintenance window.

```
Unregister-SSMTaskFromMaintenanceWindow -WindowTaskId "f34a2c47-ddfd-4c85-
a88d-72366b69af1b" -WindowId "mw-03a342e62c96d31b0"
```

Output:

```
WindowId             WindowTaskId
--------             ------------
mw-03a342e62c96d31b0 f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

- For API details, see DeregisterTaskFromMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a task from a maintenance window.

```
Unregister-SSMTaskFromMaintenanceWindow -WindowTaskId "f34a2c47-ddfd-4c85-
a88d-72366b69af1b" -WindowId "mw-03a342e62c96d31b0"
```

Output:

```
WindowId             WindowTaskId
--------             ------------
mw-03a342e62c96d31b0 f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

- For API details, see DeregisterTaskFromMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeActivations` with a CLI

The following code examples show how to use `DescribeActivations`.

CLI

AWS CLI

To describe activations

The following `describe-activations` example lists details about the activations in your AWS account.

```
aws ssm describe-activations
```

Output:

```
{
    "ActivationList": [
        {
            "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole,
            "RegistrationLimit": 5,
```

```
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
            "ActivationId": "3ee0322b-f62d-40eb-b672-13ebfEXAMPLE",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        },
    ]
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see DescribeActivations in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides details about the activations on your account.

```
Get-SSMActivation
```

Output:

```
ActivationId        : 08e51e79-1e36-446c-8e63-9458569c1363
CreatedDate         : 3/1/2017 12:01:51 AM
DefaultInstanceName : MyWebServers
Description         :
ExpirationDate      : 3/2/2017 12:01:51 AM

Use `DescribeAssociation` with a CLI

The following code examples show how to use `DescribeAssociation`.

CLI

AWS CLI

Example 1: To get details of an association

The following `describe-association` example describes the association for the specified association ID.

```
aws ssm describe-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-GatherSoftwareInventory",
        "AssociationVersion": "1",
        "Date": 1534864780.995,
        "LastUpdateAssociationDate": 1543235759.81,
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 2
            }
        },
        "DocumentVersion": "$DEFAULT",
        "Parameters": {
            "applications": [
                "Enabled"
            ],
            "awsComponents": [
                "Enabled"
            ],
            "customInventory": [
                "Enabled"
            ],
            "files": [
                ""
            ],
            "instanceDetailedInformation": [
                "Enabled"
            ],
            "networkConfig": [
                "Enabled"
            ],
            "services": [
                "Enabled"
            ],
            "windowsRegistry": [
                ""
            ],
            "windowsRoles": [
                "Enabled"
            ],
            "windowsUpdates": [
```

```
                "Enabled"
            ]
        },
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "*"
                ]
            }
        ],
        "ScheduleExpression": "rate(24 hours)",
        "LastExecutionDate": 1550501886.0,
        "LastSuccessfulExecutionDate": 1550501886.0,
        "AssociationName": "Inventory-Association"
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To get details of an association for a specific instance and document

The following `describe-association` example describes the association between an instance and a document.

```
aws ssm describe-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487876122.564,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
```

```
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Associated",
            "AssociationStatusAggregatedCount": {
                "Pending": 1
            }
        },
        "AssociationId": "d8617c07-2079-4c18-9847-1234567890ab",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487876122.564,
        "Date": 1487876122.564,
        "Targets": [
            {
                "Values": [
                    "i-1234567890abcdef0"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example describes the association between an instance and a document.

```
Get-SSMAssociation -InstanceId "i-0000293ffd8c57862" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           : i-0000293ffd8c57862
Date                 : 2/23/2017 6:55:22 PM
Status.Name          : Pending
Status.Date          : 2/20/2015 8:31:11 AM
```

```
Status.Message        : temp_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see DescribeAssociation in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example describes the association between an instance and a document.

```
Get-SSMAssociation -InstanceId "i-0000293ffd8c57862" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ffd8c57862
Date                  : 2/23/2017 6:55:22 PM
Status.Name           : Pending
Status.Date           : 2/20/2015 8:31:11 AM
Status.Message        : temp_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see DescribeAssociation in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeAssociationExecutionTargets` with a CLI

The following code examples show how to use `DescribeAssociationExecutionTargets`.

CLI

AWS CLI

To get details of an association execution

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
```

```
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --execution-id "7abb6378-a4a5-4f10-8312-0123456789ab"
```

Output:

```
{
    "AssociationExecutionTargets": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "ResourceId": "i-1234567890abcdef0",
            "ResourceType": "ManagedInstance",
            "Status": "Success",
            "DetailedStatus": "Success",
            "LastExecutionDate": 1550505538.497,
            "OutputSource": {
                "OutputSourceId": "97fff367-fc5a-4299-aed8-0123456789ab",
                "OutputSourceType": "RunCommand"
            }
        }
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutionTargets in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the resource ID and its execution status that are part of the the association execution targets

```
Get-SSMAssociationExecutionTarget -AssociationId 123a45a0-
c678-9012-3456-78901234db5e -ExecutionId 123a45a0-c678-9012-3456-78901234db5e |
 Select-Object ResourceId, Status
```

Output:

```
ResourceId           Status
----------           ------
i-0b1b2a3456f7a890b  Success
i-01c12a45d6fc7a89f  Success
i-0a1caf234f56d7dc8  Success
i-012a3fd45af6dbcfe  Failed
i-0ddc1df23c4a5fb67  Success
```

Example 2: This command checks the particular execution of a particular automation since yesterday, where a command document is associated. It further checkes if the association execution failed, and if so, it will display the command invocation details for the execution along with the instance id

```
$AssociationExecution= Get-SSMAssociationExecutionTarget -
AssociationId 1c234567-890f-1aca-a234-5a678d901cb0 -ExecutionId
 12345ca12-3456-2345-2b45-23456789012 |
    Where-Object {$_.LastExecutionDate -gt (Get-Date -Hour 00 -Minute
 00).AddDays(-1)}

foreach ($execution in $AssociationExecution) {
    if($execution.Status -ne 'Success'){
        Write-Output "There was an issue executing the association
 $($execution.AssociationId) on $($execution.ResourceId)"
        Get-SSMCommandInvocation -CommandId
 $execution.OutputSource.OutputSourceId -Detail:$true | Select-Object -
ExpandProperty CommandPlugins
    }
}
```

Output:

```
There was an issue executing the association 1c234567-890f-1aca-a234-5a678d901cb0
 on i-0a1caf234f56d7dc8

Name                   : aws:runPowerShellScript

Use `DescribeAssociationExecutions` with a CLI

The following code examples show how to use `DescribeAssociationExecutions`.

CLI

AWS CLI

Example 1: To get details of all executions for an association

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutions in *AWS CLI Command Reference*.

Use `DescribeAutomationExecutions` with a CLI

The following code examples show how to use `DescribeAutomationExecutions`.

CLI

AWS CLI

To describe an automation execution

The following `describe-automation-executions` example displays details about an Automation execution.

```
aws ssm describe-automation-executions \
    --filters Key=ExecutionId,Values=73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecutionMetadataList": [
        {
            "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
            "DocumentName": "AWS-StartEC2Instance",
            "DocumentVersion": "1",
            "AutomationExecutionStatus": "Success",
            "ExecutionStartTime": 1583737233.748,
            "ExecutionEndTime": 1583737234.719,
            "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/
mw_service_role/OrchestrationService",
            "LogFile": "",
            "Outputs": {},
            "Mode": "Auto",
            "Targets": [],
            "ResolvedTargets": {
                "ParameterValues": [],
                "Truncated": false
            },
            "AutomationType": "Local"
```

```
        }
    ]
}
```

For more information, see Running a Simple Automation Workflow in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationExecutions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example describes all active and terminated Automation Executions associated with your account.

```
Get-SSMAutomationExecutionList
```

Output:

```
AutomationExecutionId     : 4105a4fc-f944-11e6-9d32-8fb2db27a909
AutomationExecutionStatus : Failed

Use `DescribeAutomationStepExecutions` with a CLI

The following code examples show how to use `DescribeAutomationStepExecutions`.

CLI

AWS CLI

Example 1: To describe all steps for an automation execution

The following `describe-automation-step-executions` example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
```

```
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
            "OverriddenParameters": {}
        }
    ]
}
```

Example 2: To describe a specific step for an automation execution

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --filters Key=StepExecutionId,Values=95e70479-cf20-4d80-8018-7e4e2EXAMPLE
```

For more information, see Running an Automation Workflow Step by Step (Command Line) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationStepExecutions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This exmaple displays information about all active and terminated step executions in an Automation workflow.

```
Get-SSMAutomationStepExecution -AutomationExecutionId e1d2bad3-4567-8901-
ae23-456c7c8901be | Select-Object StepName, Action, StepStatus
```

Output:

```
StepName                  Action                    StepStatus

Use `DescribeAvailablePatches` with a CLI

The following code examples show how to use `DescribeAvailablePatches`.

CLI

AWS CLI

To get available patches

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \
    --
filters "Key=PRODUCT,Values=WindowsServer2019" "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{
    "Patches": [
        {
            "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
            "ReleaseDate": 1544047205.0,
            "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
            "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
```

```
 associated Microsoft Knowledge Base article for more information. After you
 install this item, you may have to restart your computer.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4470788",
            "MsrcNumber": "",
            "Language": "All"
        },
        {
            "Id": "c96115e1-5587-4115-b851-22baa46a3f11",
            "ReleaseDate": 1549994410.0,
            "Title": "2019-02 Security Update for Adobe Flash Player for Windows
 Server 2019 for x64-based Systems (KB4487038)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues
 that are included in this update, see the associated Microsoft Knowledge Base
 article. After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4487038",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4487038",
            "MsrcNumber": "",
            "Language": "All"
        },
        ...
    ]
}
```

To get details of a specific patch

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
    --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
    "Patches": [
        {
            "Id": "680861e3-fb75-432e-818e-d72e5f2be719",
            "ReleaseDate": 1546970408.0,
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues
 that are included in this update, see the associated Microsoft Knowledge Base
 article. After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4480979",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2016",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4480979",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

For more information, see How Patch Manager Operations Work in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAvailablePatches in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets all available patches for Windows Server 2012 that have a MSRC severity of Critical. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="PRODUCT";Values=@("WindowsServer2012")}
$filter2 = @{Key="MSRC_SEVERITY";Values=@("Critical")}
```

```
Get-SSMAvailablePatch -Filter $filter1,$filter2
```

Output:

```
Classification : SecurityUpdates
ContentUrl     : https://support.microsoft.com/en-us/kb/2727528
Description    : A security issue has been identified that could allow an
 unauthenticated remote attacker to compromise your system and gain control
                 over it. You can help protect your system by installing this
 update from Microsoft. After you install this update, you may have to
                 restart your system.
Id             : 1eb507be-2040-4eeb-803d-abc55700b715
KbNumber       : KB2727528
Language       : All
MsrcNumber     : MS12-072
MsrcSeverity   : Critical
Product        : WindowsServer2012
ProductFamily  : Windows
ReleaseDate    : 11/13/2012 6:00:00 PM
Title          : Security Update for Windows Server 2012 (KB2727528)
Vendor         : Microsoft
...
```

Example 2: With PowerShell version 2, you must use New-Object to create each filter.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "PRODUCT"
$filter1.Values = "WindowsServer2012"
$filter2 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter2.Key = "MSRC_SEVERITY"
$filter2.Values = "Critical"

Get-SSMAvailablePatch -Filter $filter1,$filter2
```

Example 3: This example fetches all the updates which are released in last 20 days and applicable to products matching WindowsServer2019

```
Get-SSMAvailablePatch | Where-Object ReleaseDate -ge (Get-Date).AddDays(-20)
 | Where-Object Product -eq "WindowsServer2019" | Select-Object ReleaseDate,
 Product, Title
```

Output:

```
ReleaseDate         Product           Title
-----------         -------           -----
4/9/2019 5:00:12 PM WindowsServer2019 2019-04 Security Update for Adobe Flash
 Player for Windows Server 2019 for x64-based Systems (KB4493478)
4/9/2019 5:00:06 PM WindowsServer2019 2019-04 Cumulative Update for Windows
 Server 2019 for x64-based Systems (KB4493509)
4/2/2019 5:00:06 PM WindowsServer2019 2019-03 Servicing Stack Update for Windows
 Server 2019 for x64-based Systems (KB4493510)
```

- For API details, see DescribeAvailablePatches in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

 Server 2019 for x64-based Systems (KB4493510)
```

- For API details, see DescribeAvailablePatches in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeDocument` with a CLI

The following code examples show how to use `DescribeDocument`.

CLI

AWS CLI

To display details of a document

The following `describe-document` example displays details about a Systems Manager document in your AWS account.

```
aws ssm describe-document \
    --name "Example"
```

Output:

```
{
    "Document": {
        "Hash":
 "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583257938.266,
        "Status": "Active",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified,
 Systems Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
            },
```

```
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocument in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns information about a document.

```
Get-SSMDocumentDescription -Name "RunShellScript"
```

Output:

```
CreatedDate     : 2/24/2017 5:25:13 AM
DefaultVersion  : 1
Description     : Run an updated script
DocumentType    : Command

Use `DescribeDocumentPermission` with a CLI

The following code examples show how to use `DescribeDocumentPermission`.

CLI

AWS CLI

To describe document permissions

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
    --name "Example" \
    --permission-type "Share"
```

Output:

```
{
    "AccountIds": [
        "all"
    ],
    "AccountSharingInfoList": [
        {
            "AccountId": "all",
            "SharedDocumentVersion": "$DEFAULT"
        }
    ]
}
```

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocumentPermission in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "RunShellScript"
```

Output:

```
CreatedDate          DocumentVersion IsDefaultVersion Name
-----------          --------------- ---------------- ----
2/24/2017 5:25:13 AM 1               True             RunShellScript
```

- For API details, see DescribeDocumentPermission in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "RunShellScript"
```

Output:

```
CreatedDate          DocumentVersion IsDefaultVersion Name
-----------          --------------- ---------------- ----
2/24/2017 5:25:13 AM 1               True             RunShellScript
```

- For API details, see DescribeDocumentPermission in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeEffectiveInstanceAssociations` with a CLI

The following code examples show how to use `DescribeEffectiveInstanceAssociations`.

CLI

AWS CLI

To get details of the effective associations for an instance

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

Command:

```
aws ssm describe-effective-instance-associations --instance-
id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    \"schemaVersion\": \"1.2\",\n    \"description\":
 \"Update the Amazon SSM Agent to the latest version or specified version.\",\n
  \"parameters\": {\n        \"version\": {\n            \"default\": \"\",\n
        \"description\": \"(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agent will be updated to the latest version.
\",\n            \"type\": \"String\"\n        },\n        \"allowDowngrade
\": {\n            \"default\": \"false\",\n            \"description\":
 \"(Optional) Allow the Amazon SSM Agent service to be downgraded to an earlier
 version. If set to false, the service can be upgraded to newer versions only
 (default). If set to true, specify the earlier version.\",\n            \"type
\": \"String\",\n            \"allowedValues\": [\n                \"true\",\n
              \"false\"\n            ]\n        }\n    },\n    \"runtimeConfig
\": {\n        \"aws:updateSsmAgent\": {\n            \"properties\": [\n
         {\n                \"agentName\": \"amazon-ssm-agent\",\n
  \"source\": \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-
manifest.json\",\n                \"allowDowngrade\": \"{{ allowDowngrade }}\",\n
                \"targetVersion\": \"{{ version }}\"\n                }\n
    ]\n        }\n    }\n}\n",
            "AssociationVersion": "1"
        }
    ]
}
```

- For API details, see DescribeEffectiveInstanceAssociations in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example describes the effective associations for an instance.

```
Get-SSMEffectiveInstanceAssociationList -InstanceId "i-0000293ffd8c57862" -
MaxResult 5
```

Output:

```
AssociationId                        Content
-------------                        -------
d8617c07-2079-4c18-9847-1655fc2698b0 {...
```

Example 2: This example displays the contents of the effective associations for an instance.

```
(Get-SSMEffectiveInstanceAssociationList -InstanceId "i-0000293ffd8c57862" -
MaxResult 5).Content
```

Output:

```
{
    "schemaVersion": "1.2",

Use `DescribeEffectivePatchesForPatchBaseline` with a CLI

The following code examples show how to use `DescribeEffectivePatchesForPatchBaseline`.

CLI

AWS CLI

Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current AWS account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you
 install this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
```

```
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1544047205.0
            }
        },
        {
            "Patch": {
                "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
                "ReleaseDate": 1549994400.0,
                "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and
4.7.2 for Windows Server 2019 for x64 (KB4483452)",
                "Description": "A security issue has been identified in a
Microsoft software product that could affect your system. You can help protect
your system by installing this update from Microsoft. For a complete listing
of the issues that are included in this update, see the associated Microsoft
Knowledge Base article. After you install this update, you may have to restart
your system.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Important",
                "KbNumber": "KB4483452",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1549994400.0
            }
        },
        ...
    ],
```

```
    "NextToken": "--token string truncated--"
}
```

Example 2: To get all patches defined by an AWS managed patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an AWS managed patch baseline. Note that for an AWS managed baseline, the complete baseline ARN is required for `--baseline-id`

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed"
```

See example 1 for sample output.

For more information, see How Security Patches Are Selected in the *AWS Systems Manager User Guide*.

- For API details, see DescribeEffectivePatchesForPatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all patch baselines, with a maximum result list of 1.

```
Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1
```

Output:

```
Patch                                       PatchStatus
-----                                       -----------
Amazon.SimpleSystemsManagement.Model.Patch
 Amazon.SimpleSystemsManagement.Model.PatchStatus
```

Example 2: This example displays the patch status for all patch baselines, with a maximum result list of 1.

```
(Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1).PatchStatus
```

Output:

```
ApprovalDate          DeploymentStatus
------------          ----------------
12/21/2010 6:00:00 PM APPROVED
```

- For API details, see DescribeEffectivePatchesForPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all patch baselines, with a maximum result list of 1.

```
Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1
```

Output:

```
Patch                                       PatchStatus
-----                                       -----------
Amazon.SimpleSystemsManagement.Model.Patch
 Amazon.SimpleSystemsManagement.Model.PatchStatus
```

Example 2: This example displays the patch status for all patch baselines, with a maximum result list of 1.

```
(Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1).PatchStatus
```

Output:

```
ApprovalDate          DeploymentStatus
------------          ----------------
12/21/2010 6:00:00 PM APPROVED
```

- For API details, see DescribeEffectivePatchesForPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstanceAssociationsStatus` with a CLI

The following code examples show how to use `DescribeInstanceAssociationsStatus`.

CLI

AWS CLI

To describe the status of an instance's associations

This example shows details of the associations for an instance.

Command:

```
aws ssm describe-instance-associations-status --instance-id "i-1234567890abcdef0"
```

Output:

```
{
  "InstanceAssociationStatusInfos": [
      {
          "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
          "Name": "AWS-GatherSoftwareInventory",
          "DocumentVersion": "1",
          "AssociationVersion": "1",
          "InstanceId": "i-1234567890abcdef0",
          "ExecutionDate": 1550501886.0,
          "Status": "Success",
          "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed,
 0 timedout, 0 skipped. ",
          "AssociationName": "Inventory-Association"
      },
      {
          "AssociationId": "5c5a31f6-6dae-46f9-944c-0123456789ab",
          "Name": "AWS-UpdateSSMAgent",
          "DocumentVersion": "1",
          "AssociationVersion": "1",
          "InstanceId": "i-1234567890abcdef0",
          "ExecutionDate": 1550505828.548,
```

```
            "Status": "Success",
            "DetailedStatus": "Success",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

- For API details, see DescribeInstanceAssociationsStatus in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows details of the associations for an instance.

```
Get-SSMInstanceAssociationsStatus -InstanceId "i-0000293ffd8c57862"
```

Output:

```
AssociationId    : d8617c07-2079-4c18-9847-1655fc2698b0
DetailedStatus   : Pending
DocumentVersion  : 1
ErrorCode        :
ExecutionDate    : 2/20/2015 8:31:11 AM
ExecutionSummary : temp_status_change
InstanceId       : i-0000293ffd8c57862
Name             : AWS-UpdateSSMAgent
OutputUrl        :
Status           : Pending
```

Example 2: This example checks the instance association status for the given instance id and further, displays the execution status of those associations

```
Get-SSMInstanceAssociationsStatus -InstanceId i-012e3cb4df567e8aa | ForEach-
Object {Get-SSMAssociationExecution -AssociationId .AssociationId}
```

Output:

```
AssociationId         : 512a34a5-c678-1234-1234-12345678db9e
AssociationVersion    : 2

- For API details, see DescribeInstanceAssociationsStatus in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstanceInformation` with a CLI

The following code examples show how to use `DescribeInstanceInformation`.

CLI

AWS CLI

Example 1: To describe managed instance information

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

Example 2: To describe information about a specific managed instance

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
    --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

Example 3: To describe information about managed instances with a specific tag key

The following `describe-instance-information` example shows details for managed instances that have the tag key `DEV`.

```
aws ssm describe-instance-information \
    --filters "Key=tag-key,Values=DEV"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",

Use `DescribeInstancePatchStates` with a CLI

The following code examples show how to use `DescribeInstancePatchStates`.

CLI

AWS CLI

To get the patch summary states for instances

This `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
    --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PatchGroup": "my-patch-group",
            "BaselineId": "pb-0713accee01234567",
            "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
            "CriticalNonCompliantCount": 2,
            "SecurityNonCompliantCount": 2,
            "OtherNonCompliantCount": 1,
            "InstalledCount": 123,
```

```
            "InstalledOtherCount": 334,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 1,
            "FailedCount": 2,
            "UnreportedNotApplicableCount": 11,
            "NotApplicableCount": 2063,
            "OperationStartTime": "2021-05-03T11:00:56-07:00",
            "OperationEndTime": "2021-05-03T11:01:09-07:00",
            "Operation": "Scan",
            "LastNoRebootInstallOperationTime": "2020-06-14T12:17:41-07:00",
            "RebootOption": "RebootIfNeeded"
        }
    ]
}
```

For more information, see About Patch Compliance in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStates in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch summary states for an instance.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407"
```

Example 2: This example gets the patch summary states for two instances.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407","i-09a618aec652973a9"
```

- For API details, see DescribeInstancePatchStates in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch summary states for an instance.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407"
```

Example 2: This example gets the patch summary states for two instances.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407","i-09a618aec652973a9"
```

- For API details, see DescribeInstancePatchStates in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstancePatchStatesForPatchGroup` with a CLI

The following code examples show how to use `DescribeInstancePatchStatesForPatchGroup`.

CLI

AWS CLI

Example 1: To get the instance states for a patch group

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
```

```
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,
            "NotApplicableCount": 400,

            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        },
        {
            "InstanceId": "i-0471e04240EXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-09ca3fb51fEXAMPLE",
            "SnapshotId": "05d8ffb0-1bbe-4812-ba2d-d9b7bEXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,
            "NotApplicableCount": 400,
            "OperationStartTime": "2021-08-04T22:06:20.340000-07:00",
            "OperationEndTime": "2021-08-04T22:07:11.220000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

Example 2: To get the instance states for a patch group with more than five missing patches

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=MissingCount,Type=GreaterThan,Values=5 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 46,
            "InstalledOtherCount": 4,
            "InstalledPendingRebootCount": 1,
            "InstalledRejectedCount": 1,
            "MissingCount": 7,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 232,
            "NotApplicableCount": 654,
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-04T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 1
        }
    ]
}
```

Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
```

```
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "PatchGroup": "Production",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 4,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 846,
            "NotApplicableCount": 212,
            "OperationStartTime": "2021-08-046T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-06T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

For more information, see Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStatesForPatchGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch summary states per-instance for a patch group.

```
Get-SSMInstancePatchStatesForPatchGroup -PatchGroup "Production"
```

- For API details, see DescribeInstancePatchStatesForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch summary states per-instance for a patch group.

```
Get-SSMInstancePatchStatesForPatchGroup -PatchGroup "Production"
```

- For API details, see DescribeInstancePatchStatesForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstancePatches` with a CLI

The following code examples show how to use `DescribeInstancePatches`.

CLI

AWS CLI

Example 1: To get the patch state details for an instance

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Patches": [
        {
```

```
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "KBId": "KB4480979",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2019-01-09T00:00:00+00:00"
        },
        {
            "Title": "",
            "KBId": "KB4481031",
            "Classification": "",
            "Severity": "",
            "State": "InstalledOther",
            "InstalledTime": "2019-02-08T00:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get a list of patches in the Missing state for an instance

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019
 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
```

```
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see About Patch Compliance States in the *AWS Systems Manager User Guide*.

Example 3: To get a list of patches installed since a specified InstalledTime for an instance

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Installed \
    --query "Patches[?InstalledTime >= `2023-01-01T16:00:00`]"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809)
 for x64-based Systems (KB5023702)",
            "KBId": "KB5023702",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2023-03-16T11:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

- For API details, see DescribeInstancePatches in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch compliance details for an instance.

```
Get-SSMInstancePatch -InstanceId "i-08ee91c0b17045407"
```

- For API details, see DescribeInstancePatches in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch compliance details for an instance.

```
Get-SSMInstancePatch -InstanceId "i-08ee91c0b17045407"
```

- For API details, see DescribeInstancePatches in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowExecutionTaskInvocations` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutionTaskInvocations`.

CLI

AWS CLI

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2a638355" \
```

```
    --task-id "ac0c6ae1-daa3-4a89-832e-d384503b6586"
```

Output:

```
{
    "WindowExecutionTaskInvocationIdentities": [
        {
            "Status": "SUCCESS",
            "Parameters": "{\"documentName\":\"AWS-RunShellScript\",
\"instanceIds\":[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},
\"maxConcurrency\":\"1\",\"maxErrors\":\"1\"}",
            "InvocationId": "e274b6e1-fe56-4e32-bd2a-8073c6381d8b",
            "StartTime": 1487692834.723,
            "EndTime": 1487692834.871,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2a638355",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d384503b6586"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the invocations for a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskInvocationList -TaskId "ac0c6ae1-
daa3-4a89-832e-d384503b6586" -WindowExecutionId "518d5565-5969-4cca-8f0e-

Use `DescribeMaintenanceWindowExecutionTasks` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutionTasks`.

CLI

AWS CLI

To list all tasks associated with a maintenance window execution

The following `ssm describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "WindowExecutionTaskIdentities": [
        {
            "Status": "SUCCESS",
            "TaskArn": "AWS-RunShellScript",
            "StartTime": 1487692834.684,
            "TaskType": "RUN_COMMAND",
            "EndTime": 1487692835.005,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTasks in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the tasks associated with a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskList -WindowExecutionId
 "518d5565-5969-4cca-8f0e-da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : SUCCESS
TaskArn           : AWS-RunShellScript
TaskExecutionId   : ac0c6ae1-daa3-4a89-832e-d384503b6586
TaskType          : RUN_COMMAND
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see DescribeMaintenanceWindowExecutionTasks in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the tasks associated with a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskList -WindowExecutionId
 "518d5565-5969-4cca-8f0e-da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : SUCCESS

Use `DescribeMaintenanceWindowExecutions` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutions`.

CLI

AWS CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"

        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "ff75b750-4834-4377-8f61-b3cadEXAMPLE",
            "Status": "SUCCESS",
            "StartTime": "2021-08-03T11:00:00.000000-07:00",
            "EndTime": "2021-08-03T11:37:21.450000-07:00"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
            "Status": "FAILED",
```

```
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
        "Status": "FAILED",
        "StatusDetails": "One or more tasks in the orchestration failed.",
        "StartTime": "2021-08-02T11:00:00.000000-07:00",
        "EndTime": "2021-08-02T11:22:36.190000-07:00"
    }
    ]
}
```

Example 3: To list all executions for a maintenance window after a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
        "Status": "IN_PROGRESS",
        "StartTime": "2021-08-04T11:00:00.000000-07:00"
        }
    ]
}
```

For more information, see View information about tasks and task executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all of the executions for a maintenance window.

```
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
EndTime           : 2/20/2017 6:30:17 PM

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowTargets` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowTargets`.

CLI

AWS CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Targets": [
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Single instance",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "350d44e6-28cc-44e2-951f-4b2c9EXAMPLE"
        },
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Two instances in a list",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
```

```
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE",
                        "i-0cb2b964d3EXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "e078a987-2866-47be-bedd-d9cf4EXAMPLE"
        }
    ]
}
```

Example 2: To list all targets for a maintenance window matching a specific owner information value

This `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-0ecb1226ddEXAMPLE" \
    --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```
{
    "Targets": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "WindowTargetId": "da89dcc3-7f9c-481d-ba2b-edcb7d0057f9",
            "ResourceType": "INSTANCE",
            "Targets": [
                {
                    "Key": "tag:Environment",
                    "Values": [
                        "Prod"
                    ]
                }
            ],
            "OwnerInformation": "CostCenter1",
            "Name": "ProdTarget1"
        }
    ]
```

```
}
```

            "TaskArn": "AWS-RestartEC2Instance",
            "TaskParameters": {},
```

```
            "Type": "AUTOMATION",
            "Description": "Restarting EC2 Instance for maintenance",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "My-Automation-Example-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ]
        },
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "1943dee0-0a17-4978-9bf4-3cc2fEXAMPLE",
            "TaskArn": "AWS-DisableS3BucketPublicReadWrite",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Automation task to disable read/write access on
 public S3 buckets",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Disable-S3-Public-Read-Write-Access-Automation-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ]
        }
    ]
}
```

Example 2: To list all tasks for a maintenance window that invokes the AWS-RunPowerShellScript command document

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that invokes the `AWS-RunPowerShellScript` command document.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyTask"
        }
    ]
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 3.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=Priority,Values=3"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",

Use `DescribeMaintenanceWindows` with a CLI

The following code examples show how to use `DescribeMaintenanceWindows`.

CLI

AWS CLI

Example 1: To list all maintenance windows

The following `describe-maintenance-windows` example lists all maintenance windows in your AWS account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        },
    ]
}
```

Example 2: To list all enabled maintenance windows

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Enabled,Values=true"
```

Example 3: To list maintenance windows matching a specific name

This `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Name,Values=MyMaintenanceWindow"
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindows in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all maintenance windows on your account.

```
Get-SSMMaintenanceWindowList
```

Output:

```
Cutoff   : 1
Duration : 4
Enabled  : True
Name     : My-First-Maintenance-Window
WindowId : mw-06d59c1a07c022145
```

- For API details, see DescribeMaintenanceWindows in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all maintenance windows on your account.

```
Get-SSMMaintenanceWindowList
```

Output:

```
Cutoff   : 1
Duration : 4
Enabled  : True
Name     : My-First-Maintenance-Window
WindowId : mw-06d59c1a07c022145
```

- For API details, see DescribeMaintenanceWindows in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeOpsItems` with an AWS SDK or CLI

The following code examples show how to use `DescribeOpsItems`.

CLI

AWS CLI

To list a set of OpsItems

The following `describe-ops-items` example displays a list of all open OpsItems in your AWS account.

```
aws ssm describe-ops-items \
    --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{
    "OpsItemSummaries": [
        {
            "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-

Use `DescribeParameters` with an AWS SDK or CLI

The following code examples show how to use `DescribeParameters`.

CLI

AWS CLI

Example 1: To list all parameters

The following `describe-parameters` example lists all parameters in the current AWS account and Region.

```
aws ssm describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MySecureStringParameter",
            "Type": "SecureString",
            "KeyId": "alias/aws/ssm",

            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Alejandro-
Rosalez",
```

```
            "Description": "This is a String parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "latestAmi",
            "Type": "String",
            "LastModifiedDate": 1580862415.521,
            "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/lambda-
ssm-role/Automation-UpdateSSM-Param",
            "Version": 3,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

Example 2: To list all parameters matching specific metadata

This `describe-parameters` example lists all parameters matching a filter.

aws ssm describe-parameters --filters "Key=Type,Values=StringList"

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is a StringList parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

Use `DescribePatchBaselines` with a CLI

The following code examples show how to use `DescribePatchBaselines`.

CLI

AWS CLI

Example 1: To list all patch baselines

The following `describe-patch-baselines` example retreives details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
```

```
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        },
        ...
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for
 Windows Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 2: To list all patch baselines provided by AWS

The following `describe-patch-baselines` example lists all patch baselines provided by AWS.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[AWS]"
```

Example 3: To list all patch baselines that you own

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[Self]"
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchBaselines in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all patch baselines.

```
Get-SSMPatchBaseline
```

Output:

```
BaselineDescription                                                BaselineId
                                                  BaselineName
------------------                                                ----------
                                                  ------------
Default Patch Baseline Provided by AWS.                           arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultP...
Baseline containing all updates approved for production systems
 pb-045f10b4f382baeda
 Production-B...
Baseline containing all updates approved for production systems
 pb-0a2f1059b670ebd31
 Production-B...
```

Example 2: This example lists all patch baselines provided by AWS. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("AWS")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 3: This example lists all patch baselines with you as the owner. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("Self")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 4: With PowerShell version 2, you must use New-Object to create each tag.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "OWNER"
$filter1.Values = "AWS"

Get-SSMPatchBaseline -Filter $filter1
```

Output:

```
BaselineDescription                     BaselineId
                            BaselineName             DefaultBaselin

                                                     e
-------------------                     ----------
                            ------------             --------------
Default Patch Baseline Provided by AWS. arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultPatchBaseline
 True
```

- For API details, see DescribePatchBaselines in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all patch baselines.

```
Get-SSMPatchBaseline
```

Output:

```
BaselineDescription                                          BaselineId
                                                  BaselineName
-------------------                                          ----------
                                                  ------------
Default Patch Baseline Provided by AWS.                      arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultP...

```

Example 2: This example lists all patch baselines provided by AWS. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("AWS")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 3: This example lists all patch baselines with you as the owner. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("Self")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 4: With PowerShell version 2, you must use New-Object to create each tag.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "OWNER"
$filter1.Values = "AWS"

Get-SSMPatchBaseline -Filter $filter1
```

Output:

```
BaselineDescription                     BaselineId
                            BaselineName             DefaultBaselin

                                                     e
-------------------                     ----------
                            ------------             --------------
```

```
Default Patch Baseline Provided by AWS. arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultPatchBaseline
 True
```

- For API details, see DescribePatchBaselines in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribePatchGroupState` with a CLI

The following code examples show how to use `DescribePatchGroupState`.

CLI

AWS CLI

To get the state of a patch group

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \
    --patch-group "Production"
```

Output:

```
{
    "Instances": 21,
    "InstancesWithCriticalNonCompliantPatches": 1,
    "InstancesWithFailedPatches": 2,
    "InstancesWithInstalledOtherPatches": 3,
    "InstancesWithInstalledPatches": 21,
    "InstancesWithInstalledPendingRebootPatches": 2,
    "InstancesWithInstalledRejectedPatches": 1,
    "InstancesWithMissingPatches": 3,
    "InstancesWithNotApplicablePatches": 4,
    "InstancesWithOtherNonCompliantPatches": 1,
    "InstancesWithSecurityNonCompliantPatches": 1,
```

```
    "InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>__ and Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroupState in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the high-level patch compliance summary for a patch group.

```
Get-SSMPatchGroupState -PatchGroup "Production"
```

Output:

```
Instances                          : 4
InstancesWithFailedPatches         : 1
InstancesWithInstalledOtherPatches : 4
InstancesWithInstalledPatches      : 3
InstancesWithMissingPatches        : 0
InstancesWithNotApplicablePatches  : 0
```

- For API details, see DescribePatchGroupState in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the high-level patch compliance summary for a patch group.

```
Get-SSMPatchGroupState -PatchGroup "Production"
```

Output:

```
Instances                          : 4
InstancesWithFailedPatches         : 1
```

```
InstancesWithInstalledOtherPatches : 4
InstancesWithInstalledPatches      : 3
InstancesWithMissingPatches        : 0
InstancesWithNotApplicablePatches  : 0
```

- For API details, see DescribePatchGroupState in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribePatchGroups` with a CLI

The following code examples show how to use `DescribePatchGroups`.

CLI

AWS CLI

To display patch group registrations

The following `describe-patch-groups` example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
    "Mappings": [
        {
            "PatchGroup": "Production",
            "BaselineIdentity": {
                "BaselineId": "pb-0123456789abcdef0",
                "BaselineName": "ProdPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Production",
                "DefaultBaseline": false
            }
        },
        {
```

```
            "PatchGroup": "Development",
            "BaselineIdentity": {
                "BaselineId": "pb-0713accee01234567",
                "BaselineName": "DevPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Development",
                "DefaultBaseline": true
            }
        },
        ...
    ]
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroups in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the patch group registrations.

```
Get-SSMPatchGroup
```

Output:

```
BaselineIdentity                                                PatchGroup
----------------                                                ----------
Amazon.SimpleSystemsManagement.Model.PatchBaselineIdentity Production
```

- For API details, see DescribePatchGroups in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the patch group registrations.

```
Get-SSMPatchGroup
```

Output:

```
BaselineIdentity                                                PatchGroup
----------------                                                ----------
Amazon.SimpleSystemsManagement.Model.PatchBaselineIdentity Production
```

- For API details, see DescribePatchGroups in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAutomationExecution` with a CLI

The following code examples show how to use `GetAutomationExecution`.

CLI

AWS CLI

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecution": {
        "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
        "DocumentName": "AWS-StartEC2Instance",
        "DocumentVersion": "1",
        "ExecutionStartTime": 1583737233.748,
        "ExecutionEndTime": 1583737234.719,
        "AutomationExecutionStatus": "Success",
        "StepExecutions": [
```

```
            {
                "StepName": "startInstances",
                "Action": "aws:changeInstanceState",
                "ExecutionStartTime": 1583737234.134,
                "ExecutionEndTime": 1583737234.672,
                "StepStatus": "Success",
                "Inputs": {
                    "DesiredState": "\"running\"",

Use `GetCommandInvocation` with a CLI

The following code examples show how to use `GetCommandInvocation`.

CLI

AWS CLI

To display the details of a command invocation

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",
    "InstanceId": "i-1234567890abcdef0",
    "Comment": "b48291dd-ba76-43e0-b9df-13e11ddaac26:6960febb-2907-4b59-8e1a-

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetConnectionStatus` with a CLI

The following code examples show how to use `GetConnectionStatus`.

CLI

AWS CLI

To display the connection status of a managed instance

This `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \
    --target i-1234567890abcdef0
```

Output:

```
{
    "Target": "i-1234567890abcdef0",
    "Status": "connected"
}
```

- For API details, see GetConnectionStatus in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the Session Manager connection status for an instance to determine whether it is connected and ready to receive Session Manager connections.

```
Get-SSMConnectionStatus -Target i-0a1caf234f12d3dc4
```

Output:

```
Status    Target
------    ------
Connected i-0a1caf234f12d3dc4
```

- For API details, see GetConnectionStatus in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the Session Manager connection status for an instance to determine whether it is connected and ready to receive Session Manager connections.

```
Get-SSMConnectionStatus -Target i-0a1caf234f12d3dc4
```

Output:

```
Status    Target
------    ------
Connected i-0a1caf234f12d3dc4
```

- For API details, see GetConnectionStatus in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetDefaultPatchBaseline` with a CLI

The following code examples show how to use `GetDefaultPatchBaseline`.

CLI

AWS CLI

Example 1: To display the default Windows patch baseline

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
  "BaselineId": "pb-0713accee01612345",
  "OperatingSystem": "WINDOWS"
}
```

Example 2: To display the default patch baseline for Amazon Linux

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "BaselineId": "pb-047c6eb9c8fc12345",
    "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>__ and Set an Existing Patch Baseline as the Default in the *AWS Systems Manager User Guide*.

- For API details, see GetDefaultPatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the default patch baseline.

```
Get-SSMDefaultPatchBaseline
```

Output:

```
arn:aws:ssm:us-west-2:123456789012:patchbaseline/pb-04fb4ae6142167966
```

- For API details, see GetDefaultPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the default patch baseline.

```
Get-SSMDefaultPatchBaseline
```

Output:

```
arn:aws:ssm:us-west-2:123456789012:patchbaseline/pb-04fb4ae6142167966
```

- For API details, see GetDefaultPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetDeployablePatchSnapshotForInstance` with a CLI

The following code examples show how to use `GetDeployablePatchSnapshotForInstance`.

CLI

AWS CLI

To retrieve the current snapshot for the patch baseline an instance uses

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use uuidgen to generate a snapshot-id.

```
aws ssm get-deployable-patch-snapshot-for-instance \
    --instance-id "i-1234567890abcdef0" \
    --snapshot-id "521c3536-930c-4aa9-950e-01234567abcd"
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
    "Product": "AmazonLinux2018.03",
    "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-
east-1.s3.amazonaws.com/
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-773304212436/
AMAZON_LINUX-521c3536-930c-4aa9-950e-01234567abcd?X-Amz-
Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20190215T164031Z&X-Amz-
SignedHeaders=host&X-Amz-Expires=86400&X-Amz-Credential=AKIAJ5C56P35AEBRX2QQ
%2F20190215%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-
Signature=efaaaf6e3878e77f48a6697e015efdbda9c426b09c5822055075c062f6ad2149"
}
```

For more information, see Parameter name: Snapshot ID in the *AWS Systems Manager User Guide*.

- For API details, see GetDeployablePatchSnapshotForInstance in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the current snapshot for the patch baseline used by an Instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example passes an `Amazon.Runtime.InstanceProfileAWSCredentials` object to the Credentials parameter.

```
$credentials = [Amazon.Runtime.InstanceProfileAWSCredentials]::new()
Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f" -Credentials $credentials
```

Output:

```
InstanceId          SnapshotDownloadUrl
----------          -------------------
i-0cb2b964d3e14fd9f https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...1692/4681775b-098f-4435...
```

Example 2: This example shows how to get the full SnapshotDownloadUrl. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example configures the PowerShell session to use an `Amazon.Runtime.InstanceProfileAWSCredentials` object.

```
Set-AWSCredential -Credential
 ([Amazon.Runtime.InstanceProfileAWSCredentials]::new())
(Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f").SnapshotDownloadUrl
```

Output:

```
https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...
```

- For API details, see GetDeployablePatchSnapshotForInstance in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the current snapshot for the patch baseline used by an Instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example passes an `Amazon.Runtime.InstanceProfileAWSCredentials` object to the Credentials parameter.

```
$credentials = [Amazon.Runtime.InstanceProfileAWSCredentials]::new()
Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f" -Credentials $credentials
```

Output:

```
InstanceId          SnapshotDownloadUrl
----------          -------------------
```

```
i-0cb2b964d3e14fd9f https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...1692/4681775b-098f-4435...
```

Example 2: This example shows how to get the full SnapshotDownloadUrl. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example configures the PowerShell session to use an `Amazon.Runtime.InstanceProfileAWSCredentials` object.

```
Set-AWSCredential -Credential
 ([Amazon.Runtime.InstanceProfileAWSCredentials]::new())
(Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f").SnapshotDownloadUrl
```

Output:

```
https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...
```

- For API details, see GetDeployablePatchSnapshotForInstance in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetDocument` with a CLI

The following code examples show how to use `GetDocument`.

CLI

AWS CLI

To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \
    --name "AWS-RunShellScript"
```

Output:

```
{
    "Name": "AWS-RunShellScript",
    "DocumentVersion": "1",
    "Status": "Active",
    "Content": "{\n    \"schemaVersion\":\"1.2\",\n    \"description\":\"Run
 a shell script or specify the commands to run.\",\n    \"parameters\":{\n

PowerShell

Tools for PowerShell V4

Example 1: This example returns the content of a document.

```
Get-SSMDocument -Name "RunShellScript"
```

Output:

```
Content
-------
{...
```

Example 2: This example displays the complete contents of a document.

```
(Get-SSMDocument -Name "RunShellScript").Content
{
   "schemaVersion":"2.0",
   "description":"Run an updated script",
   "parameters":{
      "commands":{
         "type":"StringList",
         "description":"(Required) Specify a shell script or a command to run.",
         "minItems":1,
         "displayType":"textarea"
      }
   },
   "mainSteps":[
      {
         "action":"aws:runShellScript",
         "name":"runShellScript",
         "inputs":{
            "commands":"{{ commands }}"
         }
      },
      {
         "action":"aws:runPowerShellScript",
         "name":"runPowerShellScript",
         "inputs":{
            "commands":"{{ commands }}"
         }
      }
   ]
}
```

Use `GetInventory` with a CLI

The following code examples show how to use `GetInventory`.

CLI

AWS CLI

To view your inventory

This example gets the custom metadata for your inventory.

Command:

```
aws ssm get-inventory
```

Output:

```
{
  "Entities": [
      {
          "Data": {
              "AWS:InstanceInformation": {
                  "Content": [
                      {
                          "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
                          "InstanceId": "i-0cb2b964d3e14fd9f",
                          "IpAddress": "172.31.44.222",
                          "AgentType": "amazon-ssm-agent",
                          "ResourceType": "EC2Instance",
                          "AgentVersion": "2.0.672.0",
                          "PlatformVersion": "2016.09",
                          "PlatformName": "Amazon Linux AMI",
                          "PlatformType": "Linux"
                      }
                  ],
                  "TypeName": "AWS:InstanceInformation",
                  "SchemaVersion": "1.0",
```

```
                    "CaptureTime": "2017-02-20T18:03:58Z"
                }
            },
            "Id": "i-0cb2b964d3e14fd9f"
        }
    ]
}
```

- For API details, see GetInventory in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the custom metadata for your inventory.

```
Get-SSMInventory
```

Output:

```
Data
     Id
----
     --
{[AWS:InstanceInformation,
 Amazon.SimpleSystemsManagement.Model.InventoryResultItem]} i-0cb2b964d3e14fd9f
```

- For API details, see GetInventory in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the custom metadata for your inventory.

```
Get-SSMInventory
```

Output:

```
Data
     Id
----
     --
```

```
{[AWS:InstanceInformation,
 Amazon.SimpleSystemsManagement.Model.InventoryResultItem]} i-0cb2b964d3e14fd9f
```

- For API details, see GetInventory in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetInventorySchema` with a CLI

The following code examples show how to use `GetInventorySchema`.

CLI

AWS CLI

To view your inventory schema

This example returns a list of inventory type names for the account.

Command:

```
aws ssm get-inventory-schema
```

Output:

```
{
  "Schemas": [
      {
          "TypeName": "AWS:AWSComponent",
          "Version": "1.0",
          "Attributes": [
              {
                  "Name": "Name",
                  "DataType": "STRING"
              },
              {
                  "Name": "ApplicationType",
                  "DataType": "STRING"
              },
```

```
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
                }
            ]
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

To view the inventory schema for a specific inventory type

This example return the inventory schema for a the AWS:AWSComponent inventory type.

Command:

```
aws ssm get-inventory-schema --type-name "AWS:AWSComponent"
```

- For API details, see GetInventorySchema in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of inventory type names for the account.

```
Get-SSMInventorySchema
```

- For API details, see GetInventorySchema in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of inventory type names for the account.

```
Get-SSMInventorySchema
```

- For API details, see GetInventorySchema in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindow` with a CLI

The following code examples show how to use `GetMaintenanceWindow`.

CLI

AWS CLI

To get information about a maintenance window

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
    --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
    "AllowUnassociatedTargets": true,
    "CreatedDate": 1515006912.957,
    "Cutoff": 1,
```

```
    "Duration": 6,
    "Enabled": true,
    "ModifiedDate": 2020-01-01T10:04:04.099Z,
    "Name": "My-Maintenance-Window",
    "Schedule": "rate(3 days)",
    "WindowId": "mw-03eb9db428EXAMPLE",
    "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindow in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets details about a maintenance window.

```
Get-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
AllowUnassociatedTargets : False
CreatedDate              : 2/20/2017 6:14:05 PM
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
ModifiedDate             : 2/20/2017 6:14:05 PM
Name                     : TestMaintWin
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see GetMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets details about a maintenance window.

```
Get-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
AllowUnassociatedTargets : False
CreatedDate              : 2/20/2017 6:14:05 PM
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
ModifiedDate             : 2/20/2017 6:14:05 PM
Name                     : TestMaintWin
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see GetMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindowExecution` with a CLI

The following code examples show how to use `GetMaintenanceWindowExecution`.

CLI

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "Status": "SUCCESS",
    "TaskIds": [
        "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
```

```
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecution in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists information about a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecution -WindowExecutionId "518d5565-5969-4cca-8f0e-
da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : FAILED
StatusDetails     : One or more tasks in the orchestration failed.
TaskIds           : {ac0c6ae1-daa3-4a89-832e-d384503b6586}
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see GetMaintenanceWindowExecution in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists information about a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecution -WindowExecutionId "518d5565-5969-4cca-8f0e-
da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : FAILED
StatusDetails     : One or more tasks in the orchestration failed.
TaskIds           : {ac0c6ae1-daa3-4a89-832e-d384503b6586}
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see GetMaintenanceWindowExecution in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindowExecutionTask` with a CLI

The following code examples show how to use `GetMaintenanceWindowExecutionTask`.

CLI

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
```

Output:

```
{
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
    "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE",
    "TaskArn": "AWS-RunPatchBaseline",
    "ServiceRole": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "Type": "RUN_COMMAND",
    "TaskParameters": [
```

```
        {
            "BaselineOverride": {
                "Values": [
                    ""
                ]
            },
            "InstallOverrideList": {
                "Values": [
                    ""
                ]
            },
            "Operation": {

                   meterValueExpression]}
Type              : RUN_COMMAND
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see GetMaintenanceWindowExecutionTask in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameter` with an AWS SDK or CLI

The following code examples show how to use `GetParameter`.

CLI

AWS CLI

Example 1: To display the value of a parameter

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
```

```
    --name "MyStringParameter"
```

Output:

```
{
    "Parameter": {
        "Name": "MyStringParameter",
        "Type": "String",
        "Value": "Veni",
        "Version": 1,
        "LastModifiedDate": 1530018761.888,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 2: To decrypt the value of a SecureString parameter

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \
    --name "MySecureStringParameter" \
    --with-decryption
```

Output:

```
{
    "Parameter": {
        "Name": "MySecureStringParameter",
        "Type": "SecureString",
        "Value": "16679b88-310b-4895-a943-e0764EXAMPLE",
        "Version": 2,
        "LastModifiedDate": 1582155479.205,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MySecureStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":label",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

Example 4: To display the value of a parameter using versions

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
    --name "MyParameter:2"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
```

```
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":2",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameter in *AWS CLI Command Reference*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    pub async fn list_path(&self, path: &str) -> Result<Vec<Parameter>, EC2Error>
{
        let maybe_params: Vec<Result<Parameter, _>> = TryFlatMap::new(
            self.inner
                .get_parameters_by_path()
                .path(path)
                .into_paginator()
                .send(),
        )
        .flat_map(|item| item.parameters.unwrap_or_default())
        .collect()
        .await;
        // Fail on the first error
        let params = maybe_params
            .into_iter()
            .collect::<Result<Vec<Parameter>, _>>()?;
        Ok(params)
```

```
    }
```

- For API details, see GetParameter in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameterHistory` with a CLI

The following code examples show how to use `GetParameterHistory`.

CLI

AWS CLI

To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the first version of my String parameter",
            "Value": "Veni",
            "Version": 1,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
```

```
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156093.471,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the second version of my String parameter",
            "Value": "Vidi",
            "Version": 2,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156117.545,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the third version of my String parameter",
            "Value": "Vici",
            "Version": 3,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Working with parameter versions in the *AWS Systems Manager User Guide*.

- For API details, see GetParameterHistory in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the value history for a parameter.

```
Get-SSMParameterHistory -Name "Welcome"
```

Output:

```
Description      :
```

```
KeyId            :
LastModifiedDate : 3/3/2017 6:55:25 PM
LastModifiedUser : arn:aws:iam::123456789012:user/admin
Name             : Welcome
Type             : String
Value            : helloWorld
```

- For API details, see GetParameterHistory in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the value history for a parameter.

```
Get-SSMParameterHistory -Name "Welcome"
```

Output:

```
Description      :
KeyId            :
LastModifiedDate : 3/3/2017 6:55:25 PM
LastModifiedUser : arn:aws:iam::123456789012:user/admin
Name             : Welcome
Type             : String
Value            : helloWorld
```

- For API details, see GetParameterHistory in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameters` with a CLI

The following code examples show how to use `GetParameters`.

CLI

AWS CLI

Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \
    --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "Value": "alpha,beta,gamma",
            "Version": 1,
            "LastModifiedDate": 1582154764.222,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MyStringListParameter"
            "DataType": "text"
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "Value": "Vici",
            "Version": 3,
            "LastModifiedDate": 1582156117.545,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MyStringParameter"
            "DataType": "text"
        }
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 2: To list names and values of multiple parameters using the ``--query`` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \
    --names MyStringParameter MyStringListParameter \
    --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[
    {
        "Name": "MyStringListParameter",
        "Value": "alpha,beta,gamma"
    },
    {
        "Name": "MyStringParameter",
        "Value": "Vidi"
    }
]
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyLabelParameter",
            "Type": "String",
            "Value": "parameter by label",
            "Version": 1,
```

```
            "Selector": ":label",
            "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
            "DataType": "text"
        },
        {
            "Name": "MyVersionParameter",
            "Type": "String",
            "Value": "parameter by version",
            "Version": 2,
            "Selector": ":2",
            "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/unlabel-param",
            "DataType": "text"
        }
    ],
    "InvalidParameters": []
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameters in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the values for a parameter.

```
Get-SSMParameterValue -Name "Welcome"
```

Output:

```
InvalidParameters Parameters
----------------- ----------
{}                {Welcome}
```

Example 2: This example lists the details of the value.

```
(Get-SSMParameterValue -Name "Welcome").Parameters
```

Output:

```
Name    Type   Value
----    ----   -----
Welcome String Good day, Sunshine!
```

- For API details, see GetParameters in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the values for a parameter.

```
Get-SSMParameterValue -Name "Welcome"
```

Output:

```
InvalidParameters Parameters
----------------- ----------
{}                {Welcome}
```

Example 2: This example lists the details of the value.

```
(Get-SSMParameterValue -Name "Welcome").Parameters
```

Output:

```
Name    Type   Value
----    ----   -----
Welcome String Good day, Sunshine!
```

- For API details, see GetParameters in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPatchBaseline` with a CLI

The following code examples show how to use `GetPatchBaseline`.

CLI

AWS CLI

To display a patch baseline

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
```

```
    "RejectedPatches": [],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "PatchGroups": [
        "QA",
        "DEV"
    ],
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see About Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the details for a patch baseline.

```
Get-SSMPatchBaselineDetail -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:02:19 PM
Name            : Production-Baseline
PatchGroups     : {}
RejectedPatches : {}
```

- For API details, see GetPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the details for a patch baseline.

```
Get-SSMPatchBaselineDetail -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:02:19 PM
Name            : Production-Baseline
PatchGroups     : {}
RejectedPatches : {}
```

- For API details, see GetPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `GetPatchBaselineForPatchGroup`.

CLI

AWS CLI

To display the patch baseline for a patch group

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
    --patch-group "DEV"
```

Output:

```
{
```

```
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the patch baseline for a patch group.

```
Get-SSMPatchBaselineForPatchGroup -PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see GetPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the patch baseline for a patch group.

```
Get-SSMPatchBaselineForPatchGroup -PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see GetPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAssociationVersions` with a CLI

The following code examples show how to use `ListAssociationVersions`.

CLI

AWS CLI

To list all versions of an association for a specific association ID

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
"AssociationVersions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "CreatedDate": 1550505536.726,
            "Name": "AWS-UpdateSSMAgent",
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ],
                "version": [
                    ""
                ]
            },
            "Targets": [
                {
```

```
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see ListAssociationVersions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves all versions of the association provided.

```
Get-SSMAssociationVersionList -AssociationId 123a45a0-c678-9012-3456-78901234db5e
```

Output:

```
AssociationId      : 123a45a0-c678-9012-3456-78901234db5e

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAssociations` with a CLI

The following code examples show how to use `ListAssociations`.

CLI

AWS CLI

Example 1: To list your associations for a specific instance

The following list-associations example lists all associations with the AssociationName, UpdateSSMAgent.

```
aws ssm list-associations /
    --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
```

```
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-016648b75dd622dab"
                    ]
                }
            ],
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Associated",
                "AssociationStatusAggregatedCount": {
                    "Pending": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

Example 2: To list your associations for a specific document

The following list-associations example lists all associations for the specified document.

```
aws ssm list-associations /
    --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
```

```
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550505828.548,
            "Overview": {
                "Status": "Success",
                "DetailedStatus": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        },
    {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationId": "fbc07ef7-b985-4684-b82b-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550507531.0,
            "Overview": {
                "Status": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

- For API details, see ListAssociations in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the associations for an instance. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="InstanceId";Value=@("i-0000293ffd8c57862")}
Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 2: This example lists all associations for a configuration document. The syntax used by this example requires PowerShell version 3 or later.

```
$filter2 = @{Key="Name";Value=@("AWS-UpdateSSMAgent")}
Get-SSMAssociationList -AssociationFilterList $filter2
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 3: With PowerShell version 2, you must use New-Object to create each filter.

```
$filter1 = New-Object Amazon.SimpleSystemsManagement.Model.AssociationFilter
```

```
$filter1.Key = "InstanceId"
$filter1.Value = "i-0000293ffd8c57862"

Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

- For API details, see ListAssociations in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the associations for an instance. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="InstanceId";Value=@("i-0000293ffd8c57862")}
Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 2: This example lists all associations for a configuration document. The syntax used by this example requires PowerShell version 3 or later.

```
$filter2 = @{Key="Name";Value=@("AWS-UpdateSSMAgent")}
```

```
Get-SSMAssociationList -AssociationFilterList $filter2
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 3: With PowerShell version 2, you must use New-Object to create each filter.

```
$filter1 = New-Object Amazon.SimpleSystemsManagement.Model.AssociationFilter
$filter1.Key = "InstanceId"
$filter1.Value = "i-0000293ffd8c57862"

Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

- For API details, see ListAssociations in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListCommandInvocations` with an AWS SDK or CLI

The following code examples show how to use `ListCommandInvocations`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To list the invocations of a specific command

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --details
```

Output:

```
{
    "CommandInvocations": [
        {
            "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",
            "InstanceId": "i-02573cafcfEXAMPLE",
            "InstanceName": "",

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import { paginateListCommandInvocations, SSMClient } from "@aws-sdk/client-ssm";
import { parseArgs } from "node:util";

/**
 * List SSM command invocations on an instance.
 * @param {{ instanceId: string }}
 */
export const main = async ({ instanceId }) => {
  const client = new SSMClient({});
  try {
    const listCommandInvocationsPaginated = [];
    // The paginate function is a wrapper around the base command.
    const paginator = paginateListCommandInvocations(
      { client },
      {
        InstanceId: instanceId,
      },
    );
    for await (const page of paginator) {
      listCommandInvocationsPaginated.push(...page.CommandInvocations);
    }
    console.log("Here is the list of command invocations:");
    console.log(listCommandInvocationsPaginated);
    return { CommandInvocations: listCommandInvocationsPaginated };
  } catch (caught) {
    if (caught instanceof Error && caught.name === "ValidationError") {
      console.warn(`${caught.message}. Did you provide a valid instance ID?`);
    }
    throw caught;
  }
};
```

- For API details, see ListCommandInvocations in *AWS SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the invocations of a command.

```
Get-SSMCommandInvocation -CommandId "b8eac879-0541-439d-94ec-47a80d554f44" -
Detail $true
```

Output:

```
CommandId          : b8eac879-0541-439d-94ec-47a80d554f44

Use `ListCommands` with a CLI

The following code examples show how to use `ListCommands`.

CLI

AWS CLI

Example 1: To get the status of a specific command

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \
    --command-id "0831e1a8-a1ac-4257-a1fd-c831bEXAMPLE"
```

Example 2: To get the status of commands requested after a specific date

The following `list-commands` example retrieves the details of commands requested after the specified date.

```
aws ssm list-commands \
    --filter "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

Example 3: To list all commands requested in an AWS account

The following `list-commands` example lists all commands requested by users in the current AWS account and Region.

```
aws ssm list-commands
```

Output:

```

}
```

To list compliance items for a specific instance and association ID

This example lists all compliance items for the specified instance and association ID.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-
types "ManagedInstance" --
filters "Key=ComplianceType,Values=Association,Type=EQUAL" "Key=Id,Values=e4c2ed6d-516f-4
aa2a-0123456789ab,Type=EQUAL"
```

To list compliance items for a instance after a specific date and time

This example lists all compliance items for an instance after the specified date and time.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-
types "ManagedInstance" --
filters "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

- For API details, see ListComplianceItems in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists compliance items list for the given resource id and type, filtering compliance-type being 'Association'

```
Get-SSMComplianceItemList -ResourceId i-1a2caf345f67d0dc2 -ResourceType
 ManagedInstance -Filter @{Key="ComplianceType";Values="Association"}
```

Output:

```
ComplianceType   : Association
Details          : {[DocumentName, AWS-GatherSoftwareInventory],
 [DocumentVersion, 1]}
ExecutionSummary :
 Amazon.SimpleSystemsManagement.Model.ComplianceExecutionSummary
```

```
Id                : 123a45a1-c234-1234-1245-67891236db4e
ResourceId        : i-1a2caf345f67d0dc2
ResourceType      : ManagedInstance
Severity          : UNSPECIFIED
Status            : COMPLIANT
Title             :
```

- For API details, see ListComplianceItems in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists compliance items list for the given resource id and type, filtering compliance-type being 'Association'

```
Get-SSMComplianceItemList -ResourceId i-1a2caf345f67d0dc2 -ResourceType
 ManagedInstance -Filter @{Key="ComplianceType";Values="Association"}
```

Output:

```
ComplianceType   : Association
Details          : {[DocumentName, AWS-GatherSoftwareInventory],
 [DocumentVersion, 1]}
ExecutionSummary :
 Amazon.SimpleSystemsManagement.Model.ComplianceExecutionSummary
Id               : 123a45a1-c234-1234-1245-67891236db4e
ResourceId       : i-1a2caf345f67d0dc2
ResourceType     : ManagedInstance

Use `ListComplianceSummaries` with a CLI

The following code examples show how to use `ListComplianceSummaries`.

CLI

AWS CLI

To list compliance summaries for all compliance types

This example lists compliance summaries for all compliance types in your account.

Command:

```
aws ssm list-compliance-summaries
```

Output:

```
{
  "ComplianceSummaryItems": [
      {
          "ComplianceType": "Association",
          "CompliantSummary": {
              "CompliantCount": 2,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 2
              }
          },
          "NonCompliantSummary": {
              "NonCompliantCount": 0,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 0
              }
          }
      },
      {
          "ComplianceType": "Patch",
```

```
            "CompliantSummary": {
                "CompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 1
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 1,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        },
                ...
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

To list compliance summaries for a specific compliance type

This example lists the compliance summary for the Patch compliance type.

Command:

```
aws ssm list-compliance-summaries --
filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListComplianceSummaries in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a summary count of compliant and non-compliant resources for all compliance types.

```
Get-SSMComplianceSummaryList
```

Output:

```
ComplianceType CompliantSummary
 NonCompliantSummary
-------------- ---------------
 -------------------
FleetTotal     Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Association    Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Custom:InSpec  Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Patch          Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
```

- For API details, see ListComplianceSummaries in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a summary count of compliant and non-compliant resources for all compliance types.

```
Get-SSMComplianceSummaryList
```

Output:

```
ComplianceType CompliantSummary
 NonCompliantSummary
-------------- ---------------
 -------------------
FleetTotal     Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
```

```
Association    Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Custom:InSpec  Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Patch          Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
```

- For API details, see ListComplianceSummaries in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListDocumentVersions` with a CLI

The following code examples show how to use `ListDocumentVersions`.

CLI

AWS CLI

To list document versions

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \
    --name "Example"
```

Output:

```
{
    "DocumentVersions": [
        {
            "Name": "Example",
            "DocumentVersion": "1",
            "CreatedDate": 1583257938.266,
            "IsDefaultVersion": true,
            "DocumentFormat": "YAML",
            "Status": "Active"
```

```
        }
    ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the *AWS Systems Manager User Guide*.

- For API details, see ListDocumentVersions in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "AWS-UpdateSSMAgent"
```

Output:

```
CreatedDate       : 6/1/2021 5:19:10 PM
DocumentFormat    : JSON
DocumentVersion   : 1
IsDefaultVersion  : True
Name              : AWS-UpdateSSMAgent
Status            : Active
```

- For API details, see ListDocumentVersions in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "AWS-UpdateSSMAgent"
```

Output:

```
CreatedDate       : 6/1/2021 5:19:10 PM
DocumentFormat    : JSON
DocumentVersion   : 1
IsDefaultVersion  : True
Name              : AWS-UpdateSSMAgent
```

```
Status              : Active
```

- For API details, see ListDocumentVersions in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListDocuments` with a CLI

The following code examples show how to use `ListDocuments`.

CLI

AWS CLI

Example 1: To list documents

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \
    --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "29884EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Automation",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": [
                {
```

```
                    "Key": "DocUse",
                    "Value": "Testing"
                }
            ]
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

Example 2: To list shared documents

The following `list-documents` example lists shared documents, including private shared documents not owned by AWS.

```
aws ssm list-documents \
    --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "12345EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Command",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": []
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see ListDocuments in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Lists all the configuration documents in your account.

```
Get-SSMDocumentList
```

Output:

```
DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ApplyPatchBaseline
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureAWSPackage
Owner           : Amazon
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 2.0

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureCloudWatch
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2
...
```

Example 2: This example retrieves all automation documents with name matchingi 'Platform'

```
Get-SSMDocumentList -DocumentFilterList @{Key="DocumentType";Value="Automation"}
 | Where-Object Name -Match "Platform"
```

Output:

```
DocumentFormat  : JSON
DocumentType    : Automation
```

```
DocumentVersion : 7
Name            : KT-Get-Platform
Owner           : 987654123456
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 0.3
Tags            : {}
TargetType      :
VersionName     :
```

- For API details, see ListDocuments in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Lists all the configuration documents in your account.

```
Get-SSMDocumentList
```

Output:

```
DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ApplyPatchBaseline
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureAWSPackage
Owner           : Amazon
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 2.0

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureCloudWatch
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2
...
```

Example 2: This example retrieves all automation documents with name matchingi 'Platform'

```
Get-SSMDocumentList -DocumentFilterList @{Key="DocumentType";Value="Automation"}
 | Where-Object Name -Match "Platform"
```

Output:

```
DocumentFormat  : JSON
DocumentType    : Automation
DocumentVersion : 7
Name            : KT-Get-Platform
Owner           : 987654123456
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 0.3
Tags            : {}
TargetType      :
VersionName     :
```

- For API details, see ListDocuments in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListInventoryEntries` with a CLI

The following code examples show how to use `ListInventoryEntries`.

CLI

AWS CLI

Example 1: To view specific inventory type entries for an instance

This following `list-inventory-entries` example lists the inventory entries for the AWS:Application inventory type on a specific instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "AWS:Application"
```

Output:

```
{
  "TypeName": "AWS:Application",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.1",
  "CaptureTime": "2019-02-15T12:17:55Z",
  "Entries": [
    {
      "Architecture": "i386",
      "Name": "Amazon SSM Agent",
      "PackageId": "{88a60be2-89a1-4df8-812a-80863c2a2b68}",
      "Publisher": "Amazon Web Services",
      "Version": "2.3.274.0"
    },
    {
      "Architecture": "x86_64",
      "InstalledTime": "2018-05-03T13:42:34Z",
      "Name": "AmazonCloudWatchAgent",
      "Publisher": "",
      "Version": "1.200442.0"
    }
  ]
}
```

Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "Custom:RackInfo"
```

Output:

```
{
  "TypeName": "Custom:RackInfo",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.0",
  "CaptureTime": "2021-05-22T10:01:01Z",
  "Entries": [
    {
      "RackLocation": "Bay B/Row C/Rack D/Shelf E"
```

```
    }
  ]
}
```

- For API details, see ListInventoryEntries in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the custom inventory entries for an instance.

```
Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo"
```

Output:

```
CaptureTime   : 2016-08-22T10:01:01Z
Entries       :
 {Amazon.Runtime.Internal.Util.AlwaysSendDictionary`2[System.String,System.String]}
InstanceId    : i-0cb2b964d3e14fd9f
NextToken     :
SchemaVersion : 1.0
TypeName      : Custom:RackInfo
```

Example 2: This example lists the details.

```
(Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo").Entries
```

Output:

```
Key          Value
---          -----
RackLocation Bay B/Row C/Rack D/Shelf E
```

- For API details, see ListInventoryEntries in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the custom inventory entries for an instance.

```
Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo"
```

Output:

```
CaptureTime   : 2016-08-22T10:01:01Z
Entries       :
 {Amazon.Runtime.Internal.Util.AlwaysSendDictionary`2[System.String,System.String]}
InstanceId    : i-0cb2b964d3e14fd9f
NextToken     :
SchemaVersion : 1.0
TypeName      : Custom:RackInfo
```

Example 2: This example lists the details.

```
(Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo").Entries
```

Output:

```
Key          Value
---          -----
RackLocation Bay B/Row C/Rack D/Shelf E
```

- For API details, see ListInventoryEntries in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListResourceComplianceSummaries` with a CLI

The following code examples show how to use `ListResourceComplianceSummaries`.

CLI

AWS CLI

To list resource-level compliance summary counts

This example lists resource-level compliance summary counts.

Command:

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
  "ResourceComplianceSummaryItems": [
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Status": "COMPLIANT",
          "OverallSeverity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550509273.0
          },
          "CompliantSummary": {
              "CompliantCount": 2,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 2
              }
          },

```

To list resource-level compliance summaries for a specific compliance type

This example lists resource-level compliance summaries for the Patch compliance type.

Command:

```
aws ssm list-resource-compliance-summaries --
filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListResourceComplianceSummaries in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets a resource-level summary count. The summary includes information about compliant and non-compliant statuses and detailed compliance-item severity counts for products that match "Windows10". Because the MaxResult default is 100 if the parameter is not specified, and this value is not valid, MaxResult parameter is added, and the value is set to 50.

```
$FilterValues = @{
  "Key"="Product"
        "Type"="EQUAL"
        "Values"="Windows10"
}
        Get-SSMResourceComplianceSummaryList -Filter $FilterValues -MaxResult 50
```

- For API details, see ListResourceComplianceSummaries in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets a resource-level summary count. The summary includes information about compliant and non-compliant statuses and detailed compliance-item severity counts for products that match "Windows10". Because the MaxResult default is 100 if the parameter is not specified, and this value is not valid, MaxResult parameter is added, and the value is set to 50.

```
$FilterValues = @{
  "Key"="Product"
        "Type"="EQUAL"
        "Values"="Windows10"
}
        Get-SSMResourceComplianceSummaryList -Filter $FilterValues -MaxResult 50
```

- For API details, see ListResourceComplianceSummaries in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListTagsForResource` with a CLI

The following code examples show how to use `ListTagsForResource`.

CLI

AWS CLI

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Region",
            "Value": "EMEA"
        }
    ]
}
```

For more information, see Tagging AWS Resources in the *AWS General Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the tags for a maintenance window.

```
Get-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow"
```

Output:

```
Key   Value
---   -----
Stack Production
```

- For API details, see ListTagsForResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the tags for a maintenance window.

```
Get-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow"
```

Output:

```
Key   Value
---   -----
Stack Production
```

- For API details, see ListTagsForResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ModifyDocumentPermission` with a CLI

The following code examples show how to use `ModifyDocumentPermission`.

CLI

AWS CLI

To modify document permissions

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \
    --name "Example" \
    --permission-type "Share" \
    --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see ModifyDocumentPermission in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds "share" permissions to all accounts for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScript" -PermissionType "Share" -
AccountIdsToAdd all
```

Example 2: This example adds "share" permissions to a specific account for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScriptNew" -PermissionType "Share" -
AccountIdsToAdd "123456789012"
```

- For API details, see ModifyDocumentPermission in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds "share" permissions to all accounts for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScript" -PermissionType "Share" -
AccountIdsToAdd all
```

Example 2: This example adds "share" permissions to a specific account for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScriptNew" -PermissionType "Share" -
AccountIdsToAdd "123456789012"
```

- For API details, see ModifyDocumentPermission in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutComplianceItems` with a CLI

The following code examples show how to use `PutComplianceItems`.

CLI

AWS CLI

To register a compliance type and compliance details to a designated instance

This example registers the compliance type `Custom:AVCheck` to the specified managed instance. There is no output if the command succeeds.

Command:

```
aws ssm put-compliance-items --resource-id "i-1234567890abcdef0" --
resource-type "ManagedInstance" --compliance-type "Custom:AVCheck"
 --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" --
items "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

- For API details, see PutComplianceItems in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example writes a custom compliance item for the given managed instance

```
$item = [Amazon.SimpleSystemsManagement.Model.ComplianceItemEntry]::new()
$item.Id = "07Jun2019-3"
$item.Severity="LOW"
$item.Status="COMPLIANT"
$item.Title="Fin-test-1 - custom"
Write-SSMComplianceItem -ResourceId mi-012dcb3ecea45b678 -ComplianceType
 Custom:VSSCompliant2 -ResourceType ManagedInstance -Item $item -
ExecutionSummary_ExecutionTime "07-Jun-2019"
```

- For API details, see PutComplianceItems in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example writes a custom compliance item for the given managed instance

```
$item = [Amazon.SimpleSystemsManagement.Model.ComplianceItemEntry]::new()
$item.Id = "07Jun2019-3"
$item.Severity="LOW"
$item.Status="COMPLIANT"
$item.Title="Fin-test-1 - custom"
Write-SSMComplianceItem -ResourceId mi-012dcb3ecea45b678 -ComplianceType
 Custom:VSSCompliant2 -ResourceType ManagedInstance -Item $item -
ExecutionSummary_ExecutionTime "07-Jun-2019"
```

- For API details, see PutComplianceItems in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutInventory` with a CLI

The following code examples show how to use `PutInventory`.

CLI

AWS CLI

To assign customer metadata to an instance

This example assigns rack location information to an instance. There is no output if the command succeeds.

Command (Linux):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
 '[{"TypeName": "Custom:RackInfo","SchemaVersion": "1.0","CaptureTime":
 "2019-01-22T10:01:01Z","Content":[{"RackLocation": "Bay B/Row C/Rack D/Shelf
 E"}]}]'
```

Command (Windows):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --
items "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Conten
 B/Row C/Rack D/Shelf F'}]"
```

- For API details, see PutInventory in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example assigns rack location information to an instance. There is no output if the command succeeds.

```
$data = New-Object
 "System.Collections.Generic.Dictionary[System.String,System.String]"
$data.Add("RackLocation", "Bay B/Row C/Rack D/Shelf F")

$items = New-Object
 "System.Collections.Generic.List[System.Collections.Generic.Dictionary[System.String,
 System.String]]"
```

```
$items.Add($data)

$customInventoryItem = New-Object
 Amazon.SimpleSystemsManagement.Model.InventoryItem
$customInventoryItem.CaptureTime = "2016-08-22T10:01:01Z"
$customInventoryItem.Content = $items
$customInventoryItem.TypeName = "Custom:TestRackInfo2"
$customInventoryItem.SchemaVersion = "1.0"

$inventoryItems = @($customInventoryItem)

Write-SSMInventory -InstanceId "i-0cb2b964d3e14fd9f" -Item $inventoryItems
```

- For API details, see PutInventory in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example assigns rack location information to an instance. There is no output if the command succeeds.

```
$data = New-Object
 "System.Collections.Generic.Dictionary[System.String,System.String]"
$data.Add("RackLocation", "Bay B/Row C/Rack D/Shelf F")

$items = New-Object
 "System.Collections.Generic.List[System.Collections.Generic.Dictionary[System.String,
 System.String]]"
$items.Add($data)

$customInventoryItem = New-Object
 Amazon.SimpleSystemsManagement.Model.InventoryItem
$customInventoryItem.CaptureTime = "2016-08-22T10:01:01Z"
$customInventoryItem.Content = $items
$customInventoryItem.TypeName = "Custom:TestRackInfo2"
$customInventoryItem.SchemaVersion = "1.0"

$inventoryItems = @($customInventoryItem)

Write-SSMInventory -InstanceId "i-0cb2b964d3e14fd9f" -Item $inventoryItems
```

- For API details, see PutInventory in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutParameter` with an AWS SDK or CLI

The following code examples show how to use `PutParameter`.

CLI

AWS CLI

Example 1: To change a parameter value

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
    --name "MyStringParameter" \
    --type "String" \
    --value "Vici" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 2: To create an advanced parameter

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
    --name "MyAdvancedParameter" \
    --description "This is an advanced parameter" \
    --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do
 eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
```

```
veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo
consequat [truncated]" \
    --type "String" \
    --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 3: To convert a standard parameter to an advanced parameter

The following `put-parameter` example converts an existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \
    --name "MyConvertedParameter" \
    --value "abc123" \
    --type "String" \
    --tier Advanced \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 4: To create a parameter with a policy attached

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "P@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification
\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},
{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":
\"60\",\"Unit\":\"Days\"}}]"
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

Example 5: To add a policy to an existing parameter

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "N3wP@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification
\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},
{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":
\"60\",\"Unit\":\"Days\"}}]"
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), Managing parameter tiers, and Working with parameter policies in the *AWS Systems Manager User Guide*.

- For API details, see PutParameter in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.ssm.SsmClient;
import software.amazon.awssdk.services.ssm.model.ParameterType;
import software.amazon.awssdk.services.ssm.model.PutParameterRequest;
import software.amazon.awssdk.services.ssm.model.SsmException;

public class PutParameter {

    public static void main(String[] args) {
        final String usage = """

                Usage:
                    <paraName>

                Where:
                    paraName - The name of the parameter.
                    paraValue - The value of the parameter.
                """;
```

```
        if (args.length != 2) {
            System.out.println(usage);
            System.exit(1);

Use `RegisterDefaultPatchBaseline` with a CLI

The following code examples show how to use `RegisterDefaultPatchBaseline`.

CLI

AWS CLI

To set the default patch baseline

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \
    --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by AWS for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0574b43a65ea646ed"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see RegisterDefaultPatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a patch baseline as the default patch baseline.

```
Register-SSMDefaultPatchBaseline -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
pb-03da896ca3b68b639
```

- For API details, see RegisterDefaultPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers a patch baseline as the default patch baseline.

```
Register-SSMDefaultPatchBaseline -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
pb-03da896ca3b68b639
```

- For API details, see RegisterDefaultPatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `RegisterPatchBaselineForPatchGroup`.

CLI

AWS CLI

To register a patch baseline for a patch group

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \
    --baseline-id "pb-045f10b4f382baeda" \
    --patch-group "Production"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda",
```

```
    "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see RegisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a patch baseline for a patch group.

```
Register-SSMPatchBaselineForPatchGroup -BaselineId "pb-03da896ca3b68b639" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-03da896ca3b68b639 Production
```

- For API details, see RegisterPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers a patch baseline for a patch group.

```
Register-SSMPatchBaselineForPatchGroup -BaselineId "pb-03da896ca3b68b639" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-03da896ca3b68b639 Production
```

- For API details, see RegisterPatchBaselineForPatchGroup in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterTargetWithMaintenanceWindow` with a CLI

The following code examples show how to use `RegisterTargetWithMaintenanceWindow`.

CLI

AWS CLI

Example 1: To register a single target with a maintenance window

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862" \
    --owner-information "Single instance" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \
    --owner-information "Two instances in a list" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-06cf17cbefcb4bf4f" \
    --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \
    --owner-information "Production Web Servers" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "INSTANCE" \
    --target "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 5: To register targets using a resource group name

The following `register-target-with-maintenance-window` example register a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "RESOURCE_GROUP" \
    --target "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTargetWithMaintenanceWindow in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers an instance with a maintenance window.

```
$option1 = @{Key="InstanceIds";Values=@("i-0000293ffd8c57862")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
d8e47760-23ed-46a5-9f28-927337725398
```

Example 2: This example registers multiple instances with a maintenance window.

```
$option1 =
 @{Key="InstanceIds";Values=@("i-0000293ffd8c57862","i-0cb2b964d3e14fd9f")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

Example 3: This example registers an instance with a maintenance window using EC2 tags.

```
$option1 = @{Key="tag:Environment";Values=@("Production")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Production Web Servers" -ResourceType "INSTANCE"
```

Output:

```
2994977e-aefb-4a71-beac-df620352f184
```

- For API details, see RegisterTargetWithMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers an instance with a maintenance window.

```
$option1 = @{Key="InstanceIds";Values=@("i-0000293ffd8c57862")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
d8e47760-23ed-46a5-9f28-927337725398
```

Example 2: This example registers multiple instances with a maintenance window.

```
$option1 =
 @{Key="InstanceIds";Values=@("i-0000293ffd8c57862","i-0cb2b964d3e14fd9f")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

Example 3: This example registers an instance with a maintenance window using EC2 tags.

```
$option1 = @{Key="tag:Environment";Values=@("Production")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Production Web Servers" -ResourceType "INSTANCE"
```

Output:

```
2994977e-aefb-4a71-beac-df620352f184
```

- For API details, see RegisterTargetWithMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterTaskWithMaintenanceWindow` with a CLI

The following code examples show how to use `RegisterTaskWithMaintenanceWindow`.

CLI

AWS CLI

Example 1: To register an Automation task with a maintenance window

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::111222333444:role/SSM --task-type AUTOMATION
 \
    --task-invocation-parameters "{\"Automation\":{\"DocumentVersion\":\"\$LATEST
\",\"Parameters\":{\"InstanceId\":[\"{{RESOURCE_ID}}\"]}}}" \
    --priority 0 \
    --max-concurrency 1 \
```

```
    --max-errors 1 \
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 2: To register a Lambda task with a Maintenance Window

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-east-1:111222333444:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::111222333444:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{"Lambda":{"Payload":"{\"InstanceId\":
\"{{RESOURCE_ID}}\",\"targetType\":\"{{TARGET_TYPE}}\"}","Qualifier":"$LATEST"}}'
 \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example" \
    --description "My Lambda Example"
```

Output:

```
{
    "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 3: To register a Run Command task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
    --service-role-arn "arn:aws:iam::111222333444:role/SSM" \
    --task-type "RUN_COMMAND" \
    --name "SSMInstallPowerShellModule" \
    --task-arn "AWS-InstallPowerShellModule" \
    --task-invocation-parameters "{\"RunCommand\":{\"Comment\":\"\",
\"OutputS3BucketName\":\"runcommandlogs\",\"Parameters\":{\"commands\":[\"Get-
Module -ListAvailable\"],\"executionTimeout\":[\"3600\"],\"source\":[\"https:\/
\/gallery.technet.microsoft.com\/EZOut-33ae0fb7\/file\/110351\/1\/EZOut.zip\"],
\"workingDirectory\":[\"\\\\\"]},\"TimeoutSeconds\":600}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 4: To register a Step Functions task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=12347414-69c3-49f8-95b8-ed2dcEXAMPLE \
    --task-arn arn:aws:states:us-
east-1:111222333444:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::111222333444:role/MaintenanceWindows \
```

```
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters '{"StepFunctions":{"Input":"{\"InstanceId\":
\"{{RESOURCE_ID}}\"}"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

Example 5: To register a task using a maintenance windows target ID

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
    --targets "Key=WindowTargetIds,Values=350d44e6-28cc-44e2-951f-4b2c9EXAMPLE" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::111222333444:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters  "{\"commands\":{\"Values\":[\"df\"]}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
```

```
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTaskWithMaintenanceWindow in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a task with a maintenance window using an instance ID. The output is the Task ID.

```
$parameters = @{}
$parameterValues = New-Object
 Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression
$parameterValues.Values = @("Install")
$parameters.Add("Operation", $parameterValues)

Register-SSMTaskWithMaintenanceWindow -WindowId "mw-03a342e62c96d31b0"
 -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole"
 -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target
 @{ Key="InstanceIds";Values="i-0000293ffd8c57862" } -TaskType "RUN_COMMAND" -
Priority 10 -TaskParameter $parameters
```

Output:

```
f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

Example 2: This example registers a task with a maintenance window using a target ID. The output is the Task ID.

```
$parameters = @{}
$parameterValues = New-Object
 Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression
$parameterValues.Values = @("Install")
$parameters.Add("Operation", $parameterValues)

register-ssmtaskwithmaintenancewindow -WindowId "mw-03a342e62c96d31b0"
 -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole"
 -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target
```

```
 @{ Key="WindowTargetIds";Values="350d44e6-28cc-44e2-951f-4b2c985838f6" } -
TaskType "RUN_COMMAND" -Priority 10 -TaskParameter $parameters
```

Output:

```
f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

Example 3: This example creates a parameter object for the run command document `AWS-RunPowerShellScript` and creates a task with given maintenance window using target ID. The return output is the task ID.

```
$parameters =
 [Collections.Generic.Dictionary[String,Collections.Generic.List[String]]]::new()
$parameters.Add("commands",@("ipconfig","dir env:\computername"))
$parameters.Add("executionTimeout",@(3600))

$props = @{
    WindowId = "mw-0123e4cce56ff78ae"

Use `RemoveTagsFromResource` with a CLI

The following code examples show how to use `RemoveTagsFromResource`.

CLI

AWS CLI

To remove a tag from a patch baseline

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0" \
```

```
    --tag-keys "Region"
```

This command produces no output.

For more information, see Tagging AWS Resources in the *AWS General Reference*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a tag from a maintenance window. There is no output if the command succeeds.

```
Remove-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -TagKey "Production"
```

- For API details, see RemoveTagsFromResource in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a tag from a maintenance window. There is no output if the command succeeds.

```
Remove-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -TagKey "Production"
```

- For API details, see RemoveTagsFromResource in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use SendCommand with an AWS SDK or CLI

The following code examples show how to use SendCommand.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

Example 1: To run a command on one or more remote instances

The following send-command example runs an echo command on a target instance.

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
    --comment "echo HelloWorld"
```

Output:

```
{
    "Command": {
        "CommandId": "92853adf-ba41-4cd6-9a88-142d1EXAMPLE",
        "DocumentName": "AWS-RunShellScript",

        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Examle 2: To get IP information about an instance

The following `send-command` example retrieves the IP information about an instance.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 3: To run a command on instances with specific tags

The following `send-command` example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
    --targets "Key=tag:ENV,Values=Dev" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 4: To run a command that sends SNS notifications

The following send-command example runs a command that sends SNS notifications for all notification events and the Command notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-
east-1:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 5: To run a command that outputs to S3 and CloudWatch

The following send-command example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-
config "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 6: To run commands on multiple instances with different tags

The following send-command example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 7: To target multiple instances with the same tag key

The following send-command example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev,Test
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

Example 8: To run a command that uses a shared document

The following send-command example runs a shared document on a target instance.

```
aws ssm send-command \
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument"
 \
    --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

See example 1 for sample output.

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see SendCommand in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

Use `StartAutomationExecution` with a CLI

The following code examples show how to use `StartAutomationExecution`.

CLI

AWS CLI

Example 1: To execute an automation document

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
    --document-name "AWS-UpdateLinuxAmi" \
    --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

Example 2: To run a shared automation document

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see StartAutomationExecution in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example runs a document specifying an Automation role, an AMI source ID, and an Amazon EC2 instance role.

```
Start-SSMAutomationExecution -DocumentName AWS-UpdateLinuxAmi -
Parameter @{'AutomationAssumeRole'='arn:aws:iam::123456789012:role/
SSMAutomationRole';'SourceAmiId'='ami-
f173cc91';'InstanceIamRole'='EC2InstanceRole'}
```

Output:

```
3a532a4f-0382-11e7-9df7-6f11185f6dd1
```

- For API details, see StartAutomationExecution in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example runs a document specifying an Automation role, an AMI source ID, and an Amazon EC2 instance role.

```
Start-SSMAutomationExecution -DocumentName AWS-UpdateLinuxAmi -
Parameter @{'AutomationAssumeRole'='arn:aws:iam::123456789012:role/
SSMAutomationRole';'SourceAmiId'='ami-
f173cc91';'InstanceIamRole'='EC2InstanceRole'}
```

Output:

```
3a532a4f-0382-11e7-9df7-6f11185f6dd1
```

- For API details, see StartAutomationExecution in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `StartSession` with a CLI

The following code examples show how to use `StartSession`.

CLI

AWS CLI

Example 1: To start a Session Manager session

This `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm start-session \
    --target "i-1234567890abcdef0"
```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

Example 2: To start a Session Manager session using SSH

This `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see Start a Session and Install the Session Manager Plugin for the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see StartSession in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example initiates a connection to a target for a Session Manager session, enabling port forwarding.

```
Start-SSMSession -Target 'i-064578e5e7454488f' -DocumentName 'AWS-
StartPortForwardingSession' -Parameter @{ localPortNumber = '8080'; portNumber =
 '80' }
```

Output:

```
SessionId    StreamUrl
----------    ----------
random-id0    wss://ssmmessages.amazonaws.com/v1/data-channel/random-id
```

- For API details, see StartSession in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example initiates a connection to a target for a Session Manager session, enabling port forwarding. Note: You need to add Region parameter if not already set using AWSCredentials.

```
Start-SSMSession -Target 'i-064578e5e7454488f' -DocumentName 'AWS-
StartPortForwardingSession' -Parameter @{ localPortNumber = '8080'; portNumber =
 '80' } -Region 'us-west-1'
```

Output:

```
Starting session with SessionId: testUser-xi4glew849asyeryde34u4dfsdfy
Port 8080 opened for sessionId testUser-xi4glew849asyeryde34u4dfsdfy.
Waiting for connections...
```

Example 2: This example creates an interactive session with a specified instance for a Session Manager session.

```
Start-SSMSession -Target 'i-1234567890abcdef0' -Region 'us-west-1'
```

Output:

```
Starting session with SessionId : testUser-xi4glew849asyeryde34u4dfsdfy
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Install the latest PowerShell for new features and improvements!

PS C:\Windows\system32> whoami
ec2amaz-fnsdrwv\ec2-test-user
PS C:\Windows\system32>
```

Example 3: This example creates a session without connecting to it and returns the SessionId, StreamUrl, and TokenValue properties required to connect to the session.

```
Start-SSMSession -Target 'i-1234567890abcdef0' -Region 'us-west-1' -
DisablePluginInvocation
```

Output:

```
SessionId        : testUser-xi4glew849asyeryde34u4dfsdfy
StreamUrl        : {StreamUrl value redacted}
```

```
TokenValue       : {Token value redacted}
ContentLength    : 1207
HttpStatusCode   : OK
```

- For API details, see StartSession in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `StopAutomationExecution` with a CLI

The following code examples show how to use `StopAutomationExecution`.

CLI

AWS CLI

To stop an automation execution

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution
    --automation-execution-id "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
```

This command produces no output.

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

- For API details, see StopAutomationExecution in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example stops an Automation Execution. There is no output if the command succeeds.

```
Stop-SSMAutomationExecution -AutomationExecutionId "4105a4fc-
f944-11e6-9d32-8fb2db27a909"
```

- For API details, see StopAutomationExecution in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example stops an Automation Execution. There is no output if the command succeeds.

```
Stop-SSMAutomationExecution -AutomationExecutionId "4105a4fc-
f944-11e6-9d32-8fb2db27a909"
```

- For API details, see StopAutomationExecution in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssociation` with a CLI

The following code examples show how to use `UpdateAssociation`.

CLI

AWS CLI

Example 1: To update a document association

The following `update-association` example updates an association with a new document version.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --document-version "\$LATEST"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
```

```
        "AssociationVersion": "2",
        "Date": 1550508093.293,
        "LastUpdateAssociationDate": 1550508106.596,
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$LATEST",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "tag:Name",
                "Values": [
                    "Linux"
                ]
            }
        ],
        "LastExecutionDate": 1550508094.879,
        "LastSuccessfulExecutionDate": 1550508094.879
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

Example 2: To update the schedule expression of an association

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-HelloWorld",
        "AssociationVersion": "2",
        "Date": "2021-02-08T13:54:19.203000-08:00",
        "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
```

```
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "aws:NoOpAutomationTag",
                "Values": [
                    "AWS-NoOpAutomationTarget-Value"
                ]
            }
        ],
        "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
        "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
        "ApplyOnlyAtCronInterval": false
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociation in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates an association with a new document version.

```
Update-SSMAssociation -AssociationId "93285663-92df-44cb-9f26-2292d4ecc439" -
DocumentVersion "1"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           :
Date                 : 3/1/2017 6:22:21 PM
Status.Name          :
Status.Date          :
Status.Message       :
```

```
Status.AdditionalInfo :
```

- For API details, see UpdateAssociation in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates an association with a new document version.

```
Update-SSMAssociation -AssociationId "93285663-92df-44cb-9f26-2292d4ecc439" -
DocumentVersion "1"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           :
Date                 : 3/1/2017 6:22:21 PM
Status.Name          :
Status.Date          :
Status.Message       :
Status.AdditionalInfo :
```

- For API details, see UpdateAssociation in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssociationStatus` with a CLI

The following code examples show how to use `UpdateAssociationStatus`.

CLI

AWS CLI

To update the association status

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
    --name "AWS-UpdateSSMAgent" \
```

```
    --instance-id "i-1234567890abcdef0" \
    --association-
status "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additi
Config-Needed"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "AssociationVersion": "1",
        "Date": 1550507529.604,
        "LastUpdateAssociationDate": 1550507806.974,
        "Status": {
            "Date": 1424421071.0,
            "Name": "Pending",
            "Message": "temp_status_change",
            "AdditionalInfo": "Additional-Config-Needed"
        },
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 1
            }
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "LastExecutionDate": 1550507808.0,
        "LastSuccessfulExecutionDate": 1550507808.0
    }
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociationStatus in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the association status of the association between an instance and a configuration document.

```
Update-SSMAssociationStatus -Name "AWS-UpdateSSMAgent" -InstanceId
 "i-0000293ffd8c57862" -AssociationStatus_Date "2015-02-20T08:31:11Z"
 -AssociationStatus_Name "Pending" -AssociationStatus_Message
 "temporary_status_change" -AssociationStatus_AdditionalInfo "Additional-Config-
Needed"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           : i-0000293ffd8c57862
Date                 : 2/23/2017 6:55:22 PM
Status.Name          : Pending
Status.Date          : 2/20/2015 8:31:11 AM
Status.Message       : temporary_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see UpdateAssociationStatus in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the association status of the association between an instance and a configuration document.

```
Update-SSMAssociationStatus -Name "AWS-UpdateSSMAgent" -InstanceId
 "i-0000293ffd8c57862" -AssociationStatus_Date "2015-02-20T08:31:11Z"
 -AssociationStatus_Name "Pending" -AssociationStatus_Message
 "temporary_status_change" -AssociationStatus_AdditionalInfo "Additional-Config-
Needed"
```

Output:

```
Name                   : AWS-UpdateSSMAgent
InstanceId             : i-0000293ffd8c57862
Date                   : 2/23/2017 6:55:22 PM
Status.Name            : Pending
Status.Date            : 2/20/2015 8:31:11 AM
Status.Message         : temporary_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see UpdateAssociationStatus in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateDocument` with a CLI

The following code examples show how to use `UpdateDocument`.

CLI

AWS CLI

To create a new version of a document

The following `update-document` example creates a new version of a document when run on a Windows computer. The document specified by `--document` must be in JSON format. Note that `file://` must be referenced followed by the path of the content file. Because of the $ at the beginning of the `--document-version` parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version "$LATEST"
```

Linux/Mac version:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version '$LATEST'
```

Output:

```
{
  "DocumentDescription": {
      "Status": "Updating",
      "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
      "Name": "RunShellScript",
      "Parameters": [
          {
              "Type": "StringList",
              "Name": "commands",
              "Description": "(Required) Specify a shell script or a command to
 run."
          }
      ],
      "DocumentType": "Command",
      "PlatformTypes": [
          "Linux"
      ],
      "DocumentVersion": "2",
      "HashType": "Sha256",
      "CreatedDate": 1487899655.152,
      "Owner": "809632081692",
      "SchemaVersion": "2.0",
      "DefaultVersion": "1",
      "LatestVersion": "2",
      "Description": "Run an updated script"
  }
}
```

- For API details, see UpdateDocument in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This creates a new version of a document with the updated contents of the json file you specify. The document must be in JSON format. You can obtain the document version with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocument -Name RunShellScript -DocumentVersion "1" -Content (Get-
Content -Raw "c:\temp\RunShellScript.json")
```

Output:

```
CreatedDate     : 3/1/2017 2:59:17 AM
DefaultVersion  : 1
Description     : Run an updated script
DocumentType    : Command
DocumentVersion : 2
Hash            :
 1d5ce820e999ff051eb4841ed887593daf77120fd76cae0d18a53cc42e4e22c1
HashType        : Sha256
LatestVersion   : 2
Name            : RunShellScript
Owner           : 809632081692
Parameters      : {commands}
PlatformTypes   : {Linux}
SchemaVersion   : 2.0
Sha1            :
Status          : Updating
```

- For API details, see UpdateDocument in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This creates a new version of a document with the updated contents of the json file you specify. The document must be in JSON format. You can obtain the document version with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocument -Name RunShellScript -DocumentVersion "1" -Content (Get-
Content -Raw "c:\temp\RunShellScript.json")
```

Output:

```
CreatedDate     : 3/1/2017 2:59:17 AM
DefaultVersion  : 1
Description     : Run an updated script
DocumentType    : Command
DocumentVersion : 2

 1d5ce820e999ff051eb4841ed887593daf77120fd76cae0d18a53cc42e4e22c1
HashType        : Sha256
LatestVersion   : 2
Name            : RunShellScript
Owner           : 809632081692
Parameters      : {commands}
PlatformTypes   : {Linux}
SchemaVersion   : 2.0
Sha1            :
Status          : Updating
```

- For API details, see UpdateDocument in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateDocumentDefaultVersion` with a CLI

The following code examples show how to use `UpdateDocumentDefaultVersion`.

CLI

AWS CLI

To update the default version of a document

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \
    --name "Example" \
    --document-version "2"
```

Output:

```
{
    "Description": {
        "Name": "Example",
        "DefaultVersion": "2"
    }
}
```

For more information, see Writing SSM Document Content in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocumentDefaultVersion in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This updates the default version of a document. You can obtain the available document versions with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocumentDefaultVersion -Name "RunShellScript" -DocumentVersion "2"
```

Output:

```
DefaultVersion Name
-------------- ----
2              RunShellScript
```

- For API details, see UpdateDocumentDefaultVersion in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This updates the default version of a document. You can obtain the available document versions with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocumentDefaultVersion -Name "RunShellScript" -DocumentVersion "2"
```

Output:

```
DefaultVersion Name
-------------- ----
```

```
2               RunShellScript
```

- For API details, see UpdateDocumentDefaultVersion in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateMaintenanceWindow` with an AWS SDK or CLI

The following code examples show how to use `UpdateMaintenanceWindow`.

CLI

AWS CLI

Example 1: To update a maintenance window

The following `update-maintenance-window` example updates the name of a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --name "My-Renamed-MW"
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 2: To disable a maintenance window

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --no-enabled
```

Example 3: To enable a maintenance window

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --enabled
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindow in *AWS CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /**
     * Updates an SSM maintenance window asynchronously.
     *
     * @param id The ID of the maintenance window to update.
     * @param name The new name for the maintenance window.
     * <p>
     * This method initiates an asynchronous request to update an SSM maintenance
window.
     * If the request is successful, it prints a success message.
     * If an exception occurs, it handles the error appropriately.
     */
    public void updateSSMMaintenanceWindow(String id, String name) throws
SsmException {
```

```
        UpdateMaintenanceWindowRequest updateRequest =
UpdateMaintenanceWindowRequest.builder()
                .windowId(id)
                .allowUnassociatedTargets(true)
                .duration(24)
                .enabled(true)
                .name(name)
                .schedule("cron(0 0 ? * MON *)")
                .build();

        CompletableFuture<UpdateMaintenanceWindowResponse> future =
getAsyncClient().updateMaintenanceWindow(updateRequest);
        future.whenComplete((response, ex) -> {
            if (response != null) {
                System.out.println("The SSM maintenance window was successfully
updated");
            } else {
                Throwable cause = (ex instanceof CompletionException) ?
ex.getCause() : ex;

PowerShell

Tools for PowerShell V4

Example 1: This example updates the name of a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Name "My-Renamed-
MW"
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
Name                     : My-Renamed-MW
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

Example 2: This example enables a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $true
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
Name                     : My-Renamed-MW
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

Example 3: This example disables a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $false
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
```

```
Duration                  : 2
Enabled                   : False
Name                      : My-Renamed-MW
Schedule                  : cron(0 */30 * * * ? *)
WindowId                  : mw-03eb9db42890fb82d
```

- For API details, see UpdateMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the name of a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Name "My-Renamed-
MW"
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
Name                     : My-Renamed-MW
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

Example 2: This example enables a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $true
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
Name                     : My-Renamed-MW
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

Example 3: This example disables a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $false
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : False
Name                     : My-Renamed-MW
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see UpdateMaintenanceWindow in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

Use `UpdateManagedInstanceRole` with a CLI

The following code examples show how to use `UpdateManagedInstanceRole`.

CLI

AWS CLI

To update the IAM role of a managed instance

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see Step 4: Create an IAM Instance Profile for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateManagedInstanceRole in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the role of a managed instance. There is no output if the command succeeds.

```
Update-SSMManagedInstanceRole -InstanceId "mi-08ab247cdf1046573" -IamRole
 "AutomationRole"
```

- For API details, see UpdateManagedInstanceRole in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the role of a managed instance. There is no output if the command succeeds.

```
Update-SSMManagedInstanceRole -InstanceId "mi-08ab247cdf1046573" -IamRole
 "AutomationRole"
```

- For API details, see UpdateManagedInstanceRole in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateOpsItem` with an AWS SDK or CLI

The following code examples show how to use `UpdateOpsItem`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

AWS CLI

To update an OpsItem

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
    --notifications "Arn=arn:aws:sns:us-east-2:111222333444:my-us-east-2-topic"
```

Output:

```
This command produces no output.
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see UpdateOpsItem in *AWS CLI Command Reference*.

Use `UpdatePatchBaseline` with a CLI

The following code examples show how to use `UpdatePatchBaseline`.

CLI

AWS CLI

Example 1: To update a patch baseline

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \
        --baseline-id "pb-0123456789abcdef0" \
        --rejected-patches "KB2032276" "MS10-048" \
        --approved-patches "KB2124261"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [
        "KB2124261"
    ],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
        "KB2032276",
        "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
```

```
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

Example 2: To rename a patch baseline

The following `update-patch-baseline` example renames the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0713accee01234567" \
    --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

For more information, see Update or Delete a Patch Baseline <https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html>`__ in the *AWS Systems Manager User Guide*.

- For API details, see UpdatePatchBaseline in *AWS CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds two patches as rejected and one patch as approved to an existing patch baseline.

```
Update-SSMPatchBaseline -BaselineId "pb-03da896ca3b68b639" -RejectedPatch
 "KB2032276","MS10-048" -ApprovedPatch "KB2124261"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {KB2124261}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:22:10 PM
Name            : Production-Baseline
RejectedPatches : {KB2032276, MS10-048}
```

- For API details, see UpdatePatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds two patches as rejected and one patch as approved to an existing patch baseline.

```
Update-SSMPatchBaseline -BaselineId "pb-03da896ca3b68b639" -RejectedPatch
 "KB2032276","MS10-048" -ApprovedPatch "KB2124261"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {KB2124261}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:22:10 PM
Name            : Production-Baseline
RejectedPatches : {KB2032276, MS10-048}
```

- For API details, see UpdatePatchBaseline in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

Logging and monitoring in AWS Systems Manager

Monitoring is an important part of maintaining the reliability, availability, and performance of AWS Systems Manager and your AWS solutions. You should collect monitoring data from all parts of your AWS solution so that you can debug a multipoint failure if one occurs. But before you start monitoring Systems Manager, create a monitoring plan that includes answers to the following questions:

- What are your monitoring goals?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who performs the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Systems Manager performance in your environment. You should measure Systems Manager performance at various times and under different load conditions. As you monitor Systems Manager, you should store a history of monitoring data that you've collected. You can compare current Systems Manager performance to this historical data to help you to identify normal performance patterns and performance anomalies, and create methods to address them.

For example, you can monitor the success or failure of operations such as Automation workflows, the application of patch baselines, maintenance window events, and configuration compliance. Automation is a tool in AWS Systems Manager.

You can also monitor CPU utilization, disk I/O, and network utilization of your managed nodes. When performance falls outside your established baseline, you might need to reconfigure or optimize the node to reduce CPU utilization, improve disk I/O, or reduce network traffic. For more information about monitoring EC2 instances, see Monitor Amazon EC2 in the *Amazon EC2 User Guide*.

Topics

- Monitoring tools
- Sending node logs to unified CloudWatch Logs (CloudWatch agent)

- Sending SSM Agent logs to CloudWatch Logs
- Monitoring your change request events
- Monitoring your automations
- Monitoring Run Command metrics using Amazon CloudWatch
- Logging AWS Systems Manager API calls with AWS CloudTrail
- Logging Automation action output with CloudWatch Logs
- Configuring Amazon CloudWatch Logs for Run Command
- Monitoring Systems Manager events with Amazon EventBridge
- Monitoring Systems Manager status changes using Amazon SNS notifications

Monitoring tools

The content in this chapter provides information for using tools available for monitoring your Systems Manager and other AWS resources. For a more complete list of tools, see Logging and monitoring in AWS Systems Manager.

Sending node logs to unified CloudWatch Logs (CloudWatch agent)

You can configure and use the Amazon CloudWatch agent to collect metrics and logs from your nodes instead of using AWS Systems Manager Agent (SSM Agent) for these tasks. The CloudWatch agent allows you to gather more metrics on EC2 instances than are available using SSM Agent. In addition, you can gather metrics from on-premises servers using the CloudWatch agent.

You can also store agent configuration settings in the Systems Manager Parameter Store for use with the CloudWatch agent. Parameter Store is a tool in AWS Systems Manager.

> **Note**
>
> AWS Systems Manager supports migrating from SSM Agent to the unified CloudWatch agent for collecting logs and metrics on 64-bit versions of Windows only. For information about setting up the unified CloudWatch agent on other operating systems, and for complete information about using the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

You can use the CloudWatch agent on other supported operating systems, but you won't be able to use Systems Manager to perform a tool migration.

SSM Agent writes information about executions, scheduled actions, errors, and health statuses to log files on each node. Manually connecting to a node to view log files and troubleshoot an issue with SSM Agent is time-consuming. For more efficient node monitoring, you can configure either SSM Agent itself or the CloudWatch agent to send this log data to Amazon CloudWatch Logs.

Important

The unified CloudWatch agent has replaced SSM Agent as the tool for sending log data to Amazon CloudWatch Logs. The SSM Agent aws:cloudWatch plugin is not supported. We recommend using only the unified CloudWatch agent for your log collection processes. For more information, see the following topics:

- Sending node logs to unified CloudWatch Logs (CloudWatch agent)
- Migrate Windows Server node log collection to the CloudWatch agent
- Collecting metrics, logs, and traces with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

Using CloudWatch Logs, you can monitor log data in real time, search and filter log data by creating one or more metric filters, and archive and retrieve historical data when you need it. For more information about CloudWatch Logs, see the *Amazon CloudWatch Logs User Guide*.

Configuring an agent to send log data to Amazon CloudWatch Logs provides the following benefits:

- Centralized log file storage for all SSM Agent log files.
- Quicker access to files to investigate errors.
- Indefinite log file retention (configurable).
- Logs can be maintained and accessed regardless of the status of the node.
- Access to other CloudWatch features such as metrics and alarms.

For information about monitoring Session Manager activity, see Logging session activity and Enabling and disabling session logging.

Migrate Windows Server node log collection to the CloudWatch agent

If you're using SSM Agent on supported Windows Server nodes to send SSM Agent log files to Amazon CloudWatch Logs, you can use Systems Manager to migrate from SSM Agent to the CloudWatch agent as your log collection tool, and migrate your configuration settings.

The CloudWatch agent isn't supported on 32-bit versions of Windows Server.

For 64-bit EC2 instances for Windows Server, you can perform the migration to the CloudWatch agent automatically or manually. For on-premises servers and virtual machines, the process must be performed manually.

Note

During the migration process, the data sent to CloudWatch might be interrupted or duplicated. Your metrics and log data will be recorded accurately again in CloudWatch after the migration is completed.

We recommend testing the migration on a limited number of nodes before migrating an entire fleet to the CloudWatch agent. After migration, if you prefer log collection with SSM Agent, you can return to using it instead.

Important

In the following cases, you won't be able to migrate to the CloudWatch agent using the steps described in this topic:

- The existing configuration for SSM Agent specifies multiple Regions.
- The existing configuration for SSM Agent specifies multiple sets of access/secret key credentials.

In these cases, it will be necessary to turn off log collection in SSM Agent and install the CloudWatch agent without a migration process. For more information, see the following topics in the *Amazon CloudWatch User Guide*:

- Installing the CloudWatch agent
- Installing the CloudWatch agent on on-premises servers

Before you begin

Before you begin a migration to the CloudWatch agent for log collection, ensure that the nodes on which you will perform the migration meet these requirements:

- The OS is a 64-bit version of Windows Server.
- SSM Agent 2.2.93.0 or later is installed on the node.
- SSM Agent is configured for monitoring on the node.

Topics

- Automatically migrating to the CloudWatch agent
- Manually migrating to the CloudWatch agent

Automatically migrating to the CloudWatch agent

For EC2 instances for Windows Server only, you can use the AWS Systems Manager console or the AWS Command Line Interface (AWS CLI) to automatically migrate to the CloudWatch agent as your log collection tool.

> **Note**
>
> AWS Systems Manager supports migrating from SSM Agent to the unified CloudWatch agent for collecting logs and metrics on 64-bit versions of Windows only. For information about setting up the unified CloudWatch agent on other operating systems, and for complete information about using the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.
>
> You can use the CloudWatch agent on other supported operating systems, but you won't be able to use Systems Manager to perform a tool migration.

After the migration succeeds, check your results in CloudWatch to ensure you're receiving the metrics, logs, or Windows event logs you expect. If you're satisfied with the results, you can optionally Store CloudWatch agent configuration settings in Parameter Store. If the migration isn't successful or the results aren't as expected, you can try Rolling back to log collection with SSM Agent.

Note

If you want to migrate a source configuration file that includes a `{hostname}` entry, then be aware that the `{hostname}` entry can change the value of the field after the migration is complete. For example, say that the following `"LogStream": "{hostname}"` entry maps to a server named *MyLogServer001*.

```
{
"Id": "CloudWatchIISLogs",
"FullName":
 "AWS.EC2.Windows.CloudWatch.CloudWatchLogsOutput,AWS.EC2.Windows.CloudWatch",
"Parameters": {
"AccessKey": "",
"SecretKey": "",
"Region": "us-east-1",
"LogGroup": "Production-Windows-IIS",
"LogStream": "{hostname}"
     }
}
```

After the migration, this entry maps to a domain, such as ip-11-1-1-11.production.ExampleCompany.com. To retain the local hostname value, specify `{local_hostname}` instead of `{hostname}`.

To automatically migrate to the CloudWatch agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AmazonCloudWatch-MigrateCloudWatchAgent`.
4. For **Status**, choose **Enabled**.
5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

7. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

8. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

9. Choose **Run**.

To automatically migrate to the CloudWatch agent (AWS CLI)

- Run the following command.

```
aws ssm send-command --document-name AmazonCloudWatch-MigrateCloudWatchAgent --
targets Key=instanceids,Values=ID1,ID2,ID3
```

   ID1, *ID2*, and *ID3* represent the IDs of nodes you want to update, such as *i-02573cafcfEXAMPLE*.

Manually migrating to the CloudWatch agent

For on-premises Windows Server nodes or EC2 instances for Windows Server, follow these steps to manually migrate log collection to the Amazon CloudWatch agent.

> **Note**
>
> If you want to migrate a source configuration file that includes a `{hostname}` entry, then be aware that the `{hostname}` entry can change the value of the field after the migration is complete. For example, say that the following `"LogStream": "{hostname}"` entry maps to a server named *MyLogServer001*.

```
{
"Id": "CloudWatchIISLogs",
"FullName":
 "AWS.EC2.Windows.CloudWatch.CloudWatchLogsOutput,AWS.EC2.Windows.CloudWatch",
"Parameters": {
"AccessKey": "",
"SecretKey": "",
"Region": "us-east-1",
"LogGroup": "Production-Windows-IIS",
"LogStream": "{hostname}"
```

```
    }
}
```

After the migration, this entry maps to a domain, such as ip-11-1-1-11.production.ExampleCompany.com. To retain the local hostname value, specify `{local_hostname}` instead of `{hostname}`.

One: To install the CloudWatch agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureAWSPackage`.
4. For **Action**, choose `Install`.
5. For **Name**, enter **`AmazonCloudWatchAgent`**.
6. For **Version**, enter **`latest`** if it isn't already provided by default.
7. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   Tip

   If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

8. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     Note

     If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Two: To update config data JSON format

- To update the JSON formatting of the existing config settings for the CloudWatch agent, use **Run Command**, a tool in AWS Systems Manager, or log in to the node directly with an RDP connection to run the following Windows PowerShell commands on the node, one at a time.

```
cd ${Env:ProgramFiles}\\Amazon\\AmazonCloudWatchAgent
```

```
.\\amazon-cloudwatch-agent-config-wizard.exe --isNonInteractiveWindowsMigration
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

Three: To configure and start the CloudWatch agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-RunPowerShellScript`.
4. For **Commands**, enter the following two commands.

```
cd ${Env:ProgramFiles}\Amazon\AmazonCloudWatchAgent
```

```
.\amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c file:config.json -s
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted,

then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

7. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

8. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

9. Choose **Run**.

Four: To turn off log collection in SSM Agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureCloudWatch`.
4. For **Status**, choose **Disabled**.

5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Status**, choose `Disabled`.
7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service

role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

    After completing these steps, check your logs in CloudWatch to verify you are receiving the metrics, logs, or Windows event logs you expect. If the results are satisfactory, you can optionally Store CloudWatch agent configuration settings in Parameter Store. If the migration isn't successful or the results aren't as expected, you can Rolling back to log collection with SSM Agent.

Store CloudWatch agent configuration settings in Parameter Store

You can store the contents of an CloudWatch agent configuration file in Parameter Store. By maintaining this configuration data in a parameter, multiple nodes can derive their configuration settings from it, and you avoid having to create or manually update configuration files on your nodes. For example, you can use Run Command to write the contents of the parameter to configuration files on multiple nodes, or use State Manager, a tool in AWS Systems Manager, to help avoid configuration drift in the CloudWatch agent configuration settings across a fleet of nodes.

When you run the CloudWatch agent configuration wizard, you can choose to let the wizard save your configuration settings as a new parameter in Parameter Store. For information about running the CloudWatch agent configuration wizard, see Create the CloudWatch agent configuration file with the wizard in the *Amazon CloudWatch User Guide*.

If you ran the wizard but didn't choose the option to save the settings as a parameter, or you created the CloudWatch agent configuration file manually, you can retrieve the data to save as a parameter on your node in the following file.

```
${Env:ProgramFiles}\Amazon\AmazonCloudWatchAgent\config.json
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

We recommend keeping a backup of the JSON in this file on a location other than the node itself.

For information about creating a parameter, see Creating Parameter Store parameters in Systems Manager.

For more information about the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

Rolling back to log collection with SSM Agent

If you want to return to using SSM Agent for log collection, follow these steps.

One: To retrieve config data from SSM Agent

1. On the node where you want to return to collecting logs with the SSM Agent, locate the contents of the SSM Agent config file. This JSON file is typically found in the following location:

   ```
   ${Env:ProgramFiles}\\Amazon\\SSM\\Plugins\\awsCloudWatch\
   \AWS.EC2.Windows.CloudWatch.json
   ```

   {Env:ProgramFiles} represents the location where the `Amazon` directory can be found, typically `C:\Program Files`.
2. Copy this data into a text file for use in a later step.

   We recommend storing a backup of the JSON on a location other than the node itself.

Two: To uninstall the CloudWatch agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureAWSPackage`.
4. For **Action**, choose **Uninstall**.

5. For **Name**, enter **`AmazonCloudWatchAgent`**.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service

role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

Three: To turn log collection back on in SSM Agent (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureCloudWatch`.
4. For **Status**, choose `Enabled`.
5. For **Properties**, paste the contents of the old config data you saved to the text file.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   Tip

   If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     Note

     If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted,

then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   Note

   The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

Sending SSM Agent logs to CloudWatch Logs

AWS Systems Manager Agent (SSM Agent) is Amazon software that runs on your EC2 instances, edge devices, on-premises servers, and virtual machines (VMs) that are configured for Systems Manager. SSM Agent processes requests from the Systems Manager service in the cloud and configures your machine as specified in the request. For more information about SSM Agent, see Working with SSM Agent.

In addition, using the following steps, you can configure SSM Agent to send log data to Amazon CloudWatch Logs.

Before you begin

Create a log group in CloudWatch Logs. For more information, see Getting started with CloudWatch Logs in the *Amazon CloudWatch Logs User Guide*.

To configure SSM Agent to send logs to CloudWatch

1. Log into a node and locate the following file:

   Linux

   On most Linux node types: `/etc/amazon/ssm/seelog.xml.template`.

   On Ubuntu Server 20.04, 18.04, and 16.04 LTS: `/snap/amazon-ssm-agent/current/seelog.xml.template`

   macOS

   `/opt/aws/ssm/seelog.xml.template`

   Windows

   `%ProgramFiles%\Amazon\SSM\seelog.xml.template`
2. Change the file name from `seelog.xml.template` to `seelog.xml`

> **Note**
>
> On Ubuntu Server 20.04, 18.04, and 16.04 LTS, the file `seelog.xml` must be created in the directory `/etc/amazon/ssm/`. You can create this directory and file by running the following commands.
>
> ```
> sudo mkdir -p /etc/amazon/ssm
> ```
>
> ```
> sudo cp -pr /snap/amazon-ssm-agent/current/* /etc/amazon/ssm
> ```
>
> ```
> sudo cp -p /etc/amazon/ssm/seelog.xml.template /etc/amazon/ssm/seelog.xml
> ```

3. Open the `seelog.xml` file in a text editor, and locate the following section.

   Linux and macOS

   ```
   <outputs formatid="fmtinfo">
      <console formatid="fmtinfo"/>
      <rollingfile type="size" filename="/var/log/amazon/ssm/amazon-ssm-agent.log"
    maxsize="30000000" maxrolls="5"/>
      <filter levels="error,critical" formatid="fmterror">
         <rollingfile type="size" filename="/var/log/amazon/ssm/errors.log"
    maxsize="10000000" maxrolls="5"/>
      </filter>
   </outputs>
   ```

   Windows

   ```
   <outputs formatid="fmtinfo">
      <console formatid="fmtinfo"/>
      <rollingfile type="size" maxrolls="5" maxsize="30000000"
    filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\amazon-ssm-agent.log"/>
      <filter formatid="fmterror" levels="error,critical">
         <rollingfile type="size" maxrolls="5" maxsize="10000000"
    filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\errors.log"/>
      </filter>
   </outputs>
   ```

4. Edit the file, and add a *custom name* element after the closing </filter> tag. In the following example, the custom name as been specified as `cloudwatch_receiver`.

   Linux and macOS

   ```
   <outputs formatid="fmtinfo">
      <console formatid="fmtinfo"/>
      <rollingfile type="size" filename="/var/log/amazon/ssm/amazon-ssm-agent.log"
    maxsize="30000000" maxrolls="5"/>
      <filter levels="error,critical" formatid="fmterror">
         <rollingfile type="size" filename="/var/log/amazon/ssm/errors.log"
    maxsize="10000000" maxrolls="5"/>
      </filter>
      <custom name="cloudwatch_receiver" formatid="fmtdebug" data-log-group="your-
   CloudWatch-log-group-name"/>
   </outputs>
   ```

Windows

```
<outputs formatid="fmtinfo">
   <console formatid="fmtinfo"/>
   <rollingfile type="size" maxrolls="5" maxsize="30000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\amazon-ssm-agent.log"/>
   <filter formatid="fmterror" levels="error,critical">
      <rollingfile type="size" maxrolls="5" maxsize="10000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\errors.log"/>
   </filter>
   <custom name="cloudwatch_receiver" formatid="fmtdebug" data-log-group="your-
CloudWatch-log-group-name"/>
</outputs>
```

5. Save your changes, and then restart SSM Agent or the node.
6. Open the CloudWatch console at https://eusc-de-east-1.console.amazonaws-eusc.eu/cloudwatch/.
7. In the navigation pane, choose **Log groups**, and then choose the name of your log group.

> **Tip**
>
> The log stream for SSM Agent log file data is organized by node ID.

Monitoring your change request events

> **Change Manager availability change**
>
> AWS Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up prior to that date. Existing customers can continue to use the service as normal. For more information, see AWS Systems Manager Change Manager availability change.

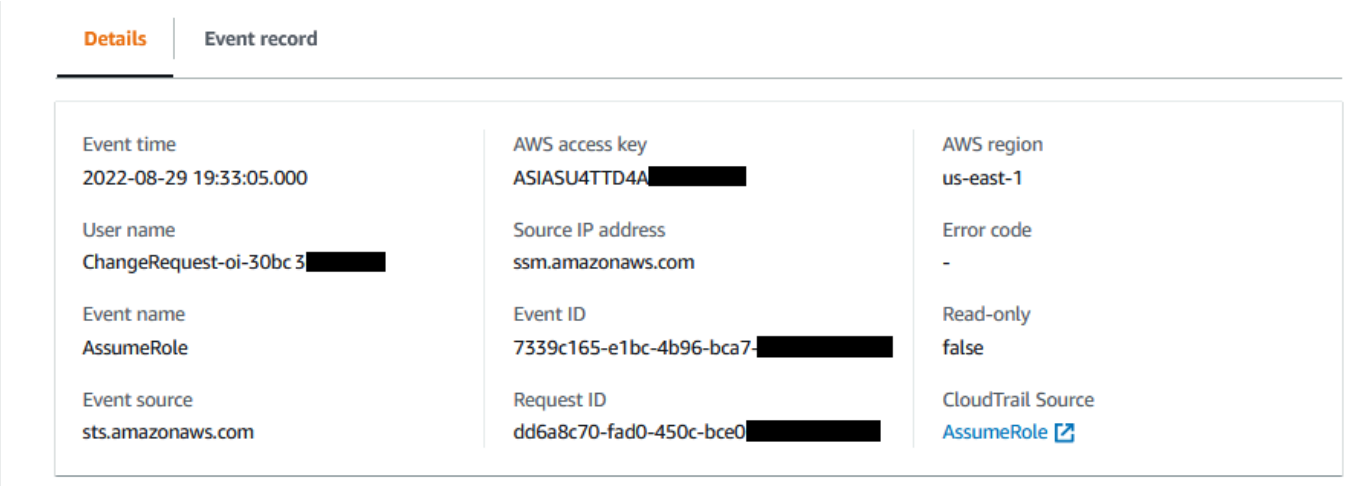
After turning on integration with AWS CloudTrail Lake and creating an event data store, you can view auditable details about the change requests that are run in your account or organization. This includes details such as the following:

- The identity of the user that initiated the change request
- The AWS Regions where the changes were made
- The source IP address for the request
- The AWS access key used for the request
- The API actions run for the change request
- The request parameters included for those actions
- The resources updated during the process

The following are samples of event details you can view for a change request after creating the event data store in AWS CloudTrail Lake.

Details

The following image shows the high-level information about a change request available on the **Details** tab. These details include information such as the time the change request operation began, the ID of the user that initiated the change request, the impacted AWS Region, and the event ID and request ID associated with the request.



Event record

The following image shows the structure of the JSON content provided by CloudTrail Lake for a change request event. This data is provided on the **Event record** tab in a change request.

> **Important**
>
> If you're using Change Manager for an organization, you can complete the following procedure while signed in to either the management account or the delegated administrator account for Change Manager.
> However, to use the delegated administrator account to complete these steps, the same delegated administrator account must be specified for both CloudTrail and Change Manager.
> When you sign in to the management account for Change Manager, you can add or change the delegated administrator account for CloudTrail on the CloudTrail Settings page. This must be done before the delegated administrator account can create an event data store for use by the entire organization.

To turn on CloudTrail Lake event tracking from Change Manager

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Change Manager**.

3. Choose the **Requests** tab.
4. Choose any existing change request, and then choose the **Associated events** tab.
5. Choose **Enable CloudTrail Lake**.
6. Follow the steps in Create an event data store for CloudTrail events in the *AWS CloudTrail User Guide*.

   To ensure that event data for your change requests is stored, make the following selections as you complete the procedure:

   - For **Event type**, leave the defaults **AWS events** and **CloudTrail events** selected.
   - If you're using Change Manager with an organization, select **Enable for all accounts in my organization**.
   - For **Management events**, do not clear the **Write** check box.

   Other options you choose when creating your event data store don't affect the storage of event data for your change requests.

Monitoring your automations

Metrics are the fundamental concept in Amazon CloudWatch. A metric represents a time-ordered set of data points that are published to CloudWatch. Think of a metric as a variable to monitor and the data points as representing the values of that variable over time.

Automation is a tool in AWS Systems Manager. Systems Manager publishes metrics about Automation usage to CloudWatch. This allows you to set alarms based on those metrics.

To view Automation metrics in the CloudWatch console

1. Open the CloudWatch console at https://eusc-de-east-1.console.amazonaws-eusc.eu/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose **SSM**.
4. On the **Metrics** tab, choose **Usage**, and then choose **By AWS Resource**.
5. In the search box near the list of metrics, enter **SSM**.

To view Automation metrics using the AWS CLI

Open a command prompt, and use the following command.

```
aws cloudwatch list-metrics \
    --namespace "AWS/Usage"
```

Automation metrics

Systems Manager sends the following Automation metrics to CloudWatch.

Metric	Description
`ConcurrentAutomationUsage`	The number of automations running at the same time in the current AWS account and AWS Region.
`QueuedAutomationUsage`	The number of automations currently queued that have not started and have a status of `Pending`.

For more information about working with CloudWatch metrics, see the following topics in the *Amazon CloudWatch User Guide*:

- Metrics
- Using Amazon CloudWatch metrics
- Using Amazon CloudWatch alarms

Monitoring Run Command metrics using Amazon CloudWatch

Metrics are the fundamental concept in Amazon CloudWatch. A metric represents a time-ordered set of data points that are published to CloudWatch. Think of a metric as a variable to monitor, and the data points as representing the values of that variable over time.

AWS Systems Manager publishes metrics about the status of Run Command commands to CloudWatch, allowing you to set alarms based on those metrics. Run Command is a tool in AWS

Systems Manager. These statistics are recorded for an extended period so you can access historical information and gain a better perspective on the success rate of commands run in your AWS account.

The terminal status values for commands for which you can track metrics include `Success`, `Failed`, and `Delivery Timed Out`. For example, for an SSM Command document set to run every hour, you can configure an alarm to notify you when a status of `Success` isn't reported for any of those hours. For more information about command status values, see Understanding command statuses.

To view metrics in the CloudWatch console

1. Open the CloudWatch console at https://eusc-de-east-1.console.amazonaws-eusc.eu/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. In the **Alarms by AWS service** area, for **Services**, choose **SSM-Run Command**.

To view metrics using the AWS CLI

Open a command prompt, and use the following command.

```
aws cloudwatch list-metrics --namespace "AWS/SSM-RunCommand"
```

To list all available metrics, use the following command.

```
aws cloudwatch list-metrics
```

Systems Manager Run Command metrics and dimensions

Systems Manager sends Run Command command metrics to CloudWatch one time every minute.

Systems Manager sends the following command metrics to CloudWatch.

> **Note**
>
> These metrics use `Count` as the unit, so `Sum` and `SampleCount` are the most useful statistics.

Metric	Description
CommandsDeliveryTimedOut	The number of commands that have a terminal status of Delivery Timed Out.
CommandsFailed	The number of commands that have a terminal status of Failed.
CommandsSucceeded	The number of commands that have a terminal status of Success.

For more information about working with CloudWatch metrics, see the following topics in the *Amazon CloudWatch User Guide*:

- Metrics
- Using Amazon CloudWatch metrics
- Using Amazon CloudWatch alarms

Logging AWS Systems Manager API calls with AWS CloudTrail

AWS Systems Manager is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures all API calls for Systems Manager as events. The calls captured include calls from the Systems Manager console and code calls to the Systems Manager API operations. Using the information collected by CloudTrail, you can determine the request that was made to Systems Manager, the IP address from which the request was made, when it was made, and additional details.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or user credentials.
- Whether the request was made on behalf of an IAM Identity Center user.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

CloudTrail is active in your AWS account when you create the account and you automatically have access to the CloudTrail **Event history**. The CloudTrail **Event history** provides a viewable, searchable, downloadable, and immutable record of the past 90 days of recorded management events in an AWS Region. For more information, see Working with CloudTrail Event history in the *AWS CloudTrail User Guide*. There are no CloudTrail charges for viewing the **Event history**.

For an ongoing record of events in your AWS account past 90 days, create a trail or a CloudTrail Lake event data store.

CloudTrail trails

A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. All trails created using the AWS Management Console are multi-Region. You can create a single-Region or a multi-Region trail by using the AWS CLI. Creating a multi-Region trail is recommended because you capture activity in all AWS Regions in your account. If you create a single-Region trail, you can view only the events logged in the trail's AWS Region. For more information about trails, see Creating a trail for your AWS account and Creating a trail for an organization in the *AWS CloudTrail User Guide*.

You can deliver one copy of your ongoing management events to your Amazon S3 bucket at no charge from CloudTrail by creating a trail, however, there are Amazon S3 storage charges. For more information about CloudTrail pricing, see AWS CloudTrail Pricing. For information about Amazon S3 pricing, see Amazon S3 Pricing.

CloudTrail Lake event data stores

CloudTrail Lake lets you run SQL-based queries on your events. CloudTrail Lake converts existing events in row-based JSON format to Apache ORC format. ORC is a columnar storage format that is optimized for fast retrieval of data. Events are aggregated into *event data stores*, which are immutable collections of events based on criteria that you select by applying advanced event selectors. The selectors that you apply to an event data store control which events persist and are available for you to query. For more information about CloudTrail Lake, see Working with AWS CloudTrail Lake in the *AWS CloudTrail User Guide*.

CloudTrail Lake event data stores and queries incur costs. When you create an event data store, you choose the pricing option you want to use for the event data store. The pricing option determines the cost for ingesting and storing events, and the default and maximum retention period for the event data store. For more information about CloudTrail pricing, see AWS CloudTrail Pricing.

Systems Manager data events in CloudTrail

Data events provide information about the resource operations performed on or in a resource (for example, creating or opening a control channel). These are also known as data plane operations. Data events are often high-volume activities. By default, CloudTrail doesn't log data events. The CloudTrail **Event history** doesn't record data events.

Additional charges apply for data events. For more information about CloudTrail pricing, see AWS CloudTrail Pricing.

You can log data events for the Systems Manager resource types by using the CloudTrail console, AWS CLI, or CloudTrail API operations. For more information about how to log data events, see Logging data events with the AWS Management Console and Logging data events with the AWS Command Line Interface in the *AWS CloudTrail User Guide*.

The following table lists the Systems Manager resource types for which you can log data events. The **Data event type (console)** column shows the value to choose from the **Data event type** list on the CloudTrail console. The **resources.type value** column shows the `resources.type` value, which you would specify when configuring advanced event selectors using the AWS CLI or CloudTrail APIs. The **Data APIs logged to CloudTrail** column shows the API calls logged to CloudTrail for the resource type.

Data event type (console)	resources.type value	Data APIs logged to CloudTrail
Systems Manager	`AWS::SSMMessages::ControlChannel`	• `CreateControlChannel` • `OpenControlChannel` For more information about these operations, see Actions defined by Amazon Message Gateway Service in the *Service Authorization Reference*.
Systems Manager managed node	`AWS::SSM::ManagedNode`	• `RequestManagedInstanceRoleToken` – This

Data event type (console)	resources.type value	Data APIs logged to CloudTrail
		event is generated when the AWS Systems Manager Agent (SSM Agent) running on a node managed by Systems Manager requests credentials from the Systems Manager credentia l service. For more information about the `RequestManagedInst anceRoleToken` operation , see Validating hybrid-ac tivated machines using a hardware fingerprint

You can configure advanced event selectors to filter on the `eventName`, `readOnly`, and `resources.`ARN fields to log only those events that are important to you. For more information about these fields, see AdvancedFieldSelector in the *AWS CloudTrail API Reference*.

Systems Manager management events in CloudTrail

Management events provide information about management operations that are performed on resources in your AWS account. These are also known as control plane operations. By default, CloudTrail logs management events.

Systems Manager logs all control plane operations to CloudTrail as management events. Systems Manager API operations are documented in the AWS Systems Manager API Reference. For example, calls to the `CreateMaintenanceWindows`, `PutInventory`, `SendCommand`, and `StartSession` actions generate entries in the CloudTrail log files. For an example of setting up CloudTrail to monitor a Systems Manager API call, see Monitoring session activity using Amazon EventBridge (console).

Systems Manager event examples

An event represents a single request from any source and includes information about the requested API operation, the date and time of the operation, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so events don't appear in any specific order.

Examples:

- Management event examples
- Data event examples

Management event examples

Example 1: `DeleteDocument`

The following example shows a CloudTrail event that demonstrates the `DeleteDocument` operation on a document named `example-Document` in the US East (Ohio) Region (us-east-2).

```
{
    "eventVersion": "1.04",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AKIAI44QH8DHBEXAMPLE:203.0.113.11",
        "arn": "arn:aws:sts::123456789012:assumed-role/example-role/203.0.113.11",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "attributes": {
                "mfaAuthenticated": "false",
                "creationDate": "2018-03-06T20:19:16Z"
            },
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AKIAI44QH8DHBEXAMPLE",
                "arn": "arn:aws:iam::123456789012:role/example-role",
                "accountId": "123456789012",
                "userName": "example-role"
            }
        }
    },
```

```
    "eventTime": "2018-03-06T20:30:12Z",
    "eventSource": "ssm.amazonaws.com",
    "eventName": "DeleteDocument",
    "awsRegion": "us-east-2",
    "sourceIPAddress": "203.0.113.11",
    "userAgent": "example-user-agent-string",
    "requestParameters": {
        "name": "example-Document"
    },
    "responseElements": null,
    "requestID": "86168559-75e9-11e4-8cf8-75d18EXAMPLE",
    "eventID": "832b82d5-d474-44e8-a51d-093ccEXAMPLE",
    "resources": [
        {
            "ARN": "arn:aws:ssm:us-east-2:123456789012:document/example-Document",
            "accountId": "123456789012"
        }
    ],
    "eventType": "AwsApiCall",
    "recipientAccountId": "123456789012",
    "eventCategory": "Management"
}
```

Example 2: `StartConnection`

The following example shows a CloudTrail event for a user who starts an RDP connection using Fleet Manager in the US East (Ohio) Region (us-east-2). The underlying API action is `StartConnection`.

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AKIAI44QH8DHBEXAMPLE",
        "arn": "arn:aws:sts::123456789012:assumed-role/exampleRole",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AKIAI44QH8DHBEXAMPLE",
                "arn": "arn:aws:sts::123456789012:assumed-role/exampleRole",
                "accountId": "123456789012",
```

```
                "userName": "exampleRole"
            },
            "webIdFederationData": {},
            "attributes": {
                "creationDate": "2021-12-13T14:57:05Z",
                "mfaAuthenticated": "false"
            }
        }
    },
    "eventTime": "2021-12-13T16:50:41Z",
    "eventSource": "ssm-guiconnect.amazonaws.com",
    "eventName": "StartConnection",
    "awsRegion": "us-east-2",
    "sourceIPAddress": "34.230.45.60",
    "userAgent": "example-user-agent-string",
    "requestParameters": {
        "AuthType": "Credentials",
        "Protocol": "RDP",
        "ConnectionType": "SessionManager",
        "InstanceId": "i-02573cafcfEXAMPLE"
    },
    "responseElements": {
        "ConnectionArn": "arn:aws:ssm-guiconnect:us-east-2:123456789012:connection/
fcb810cd-241f-4aae-9ee4-02d59EXAMPLE",
        "ConnectionKey": "71f9629f-0f9a-4b35-92f2-2d253EXAMPLE",
        "ClientToken": "49af0f92-d637-4d47-9c54-ea51aEXAMPLE",
        "requestId": "d466710f-2adf-4e87-9464-055b2EXAMPLE"
    },
    "requestID": "d466710f-2adf-4e87-9464-055b2EXAMPLE",
    "eventID": "fc514f57-ba19-4e8b-9079-c2913EXAMPLE",
    "readOnly": false,
    "eventType": "AwsApiCall",
    "managementEvent": true,
    "recipientAccountId": "123456789012",
    "eventCategory": "Management"
}
```

Data event examples

Example 1: `CreateControlChannel`

The following example shows a CloudTrail event that demonstrates the `CreateControlChannel` operation.

```
{
  "eventVersion":"1.08",
  "userIdentity":{
    "type":"AssumedRole",
    "principalId":"AKIAI44QH8DHBEXAMPLE",
    "arn":"arn:aws:sts::123456789012:assumed-role/exampleRole",
    "accountId":"123456789012",
    "accessKeyId":"AKIAI44QH8DHBEXAMPLE",
    "sessionContext":{
      "sessionIssuer":{
        "type":"Role",
        "principalId":"AKIAI44QH8DHBEXAMPLE",
        "arn":"arn:aws:iam::123456789012:role/exampleRole",
        "accountId":"123456789012",
        "userName":"exampleRole"
      },
      "attributes":{
        "creationDate":"2023-05-04T23:14:50Z",
        "mfaAuthenticated":"false"
      }
    }
  },
  "eventTime":"2023-05-04T23:53:55Z",
  "eventSource":"ssm.amazonaws.com",
  "eventName":"CreateControlChannel",
  "awsRegion":"us-east-1",
  "sourceIPAddress":"192.0.2.0",
  "userAgent":"example-agent",
  "requestParameters":{
    "channelId":"44295c1f-49d2-48b6-b218-96823EXAMPLE",
    "messageSchemaVersion":"1.0",
    "requestId":"54993150-0e8f-4142-aa54-3438EXAMPLE",
    "userAgent":"example-agent"
  },
  "responseElements":{
    "messageSchemaVersion":"1.0",
    "tokenValue":"Value hidden due to security reasons.",
    "url":"example-url"
  },
  "requestID":"54993150-0e8f-4142-aa54-3438EXAMPLE",
  "eventID":"a48a28de-7996-4ca1-a3a0-a51fEXAMPLE",
  "readOnly":false,
  "resources":[
```

```
    {
      "accountId":"123456789012",
      "type":"AWS::SSMMessages::ControlChannel",
      "ARN":"arn:aws:ssmmessages:us-east-1:123456789012:control-
channel/44295c1f-49d2-48b6-b218-96823EXAMPLE"
    }
  ],
  "eventType":"AwsApiCall",
  "managementEvent":false,
  "recipientAccountId":"123456789012",
  "eventCategory":"Data"
}
```

Example 2: `RequestManagedInstanceRoleToken`

The following example shows a CloudTrail event that demonstrates the `RequestManagedInstanceRoleToken` operation.

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "123456789012:aws:ec2-instance:i-02854e4bEXAMPLE",
        "arn": "arn:aws:sts::123456789012:assumed-role/aws:ec2-instance/
i-02854e4bEXAMPLE",
        "accountId": "123456789012",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "123456789012:aws:ec2-instance",
                "arn": "arn:aws:iam::123456789012:role/aws:ec2-instance",
                "accountId": "123456789012",
                "userName": "aws:ec2-instance"
            },
            "attributes": {
                "creationDate": "2023-08-27T03:34:46Z",
                "mfaAuthenticated": "false"
            },
            "ec2RoleDelivery": "2.0"
        }
    },
    "eventTime": "2023-08-27T03:37:15Z",
```

```
    "eventSource": "ssm.amazonaws.com",
    "eventName": "RequestManagedInstanceRoleToken",
    "awsRegion": "us-east-1",
    "sourceIPAddress": "192.0.2.0",
    "userAgent": "Apache-HttpClient/UNAVAILABLE (Java/1.8.0_362)",
    "requestParameters": {
        "fingerprint": "i-02854e4bf85EXAMPLE"
    },
    "responseElements": null,
    "requestID": "2582cced-455b-4189-9b82-7b48EXAMPLE",
    "eventID": "7f200508-e547-4c27-982d-4da0EXAMLE",
    "readOnly": true,
    "resources": [
        {
            "accountId": "123456789012",
            "type": "AWS::SSM::ManagedNode",
            "ARN": "arn:aws:ec2:us-east-1:123456789012:instance/i-02854e4bEXAMPLE"
        }
    ],
    "eventType": "AwsApiCall",
    "managementEvent": false,
    "recipientAccountId": "123456789012",
    "eventCategory": "Data"
}
```

For information about CloudTrail record contents, see CloudTrail record contents in the *AWS CloudTrail User Guide*.

Logging Automation action output with CloudWatch Logs

Automation, a tool in AWS Systems Manager, integrates with Amazon CloudWatch Logs. You can send the output from `aws:executeScript` actions in your runbooks to the log group you specify. Systems Manager doesn't create a log group or any log streams for documents that don't use `aws:executeScript` actions. If the document does use `aws:executeScript`, the output sent to CloudWatch Logs only pertains to those actions. You can use the `aws:executeScript` action output stored in your CloudWatch Logs log group for debugging and troubleshooting purposes. If you choose a log group that is encrypted, the `aws:executeScript` action output is also encrypted. Logging output from `aws:executeScript` actions is an account-level setting.

To send action output to CloudWatch Logs for Amazon owned runbooks, the user or role that runs the automation must have permissions for the following operations:

- `logs:CreateLogGroup`
- `logs:CreateLogStream`
- `logs:DescribeLogGroups`
- `logs:DescribeLogStreams`
- `logs:PutLogEvents`

For runbooks that you own, the same permissions must be added to the IAM service role (or AssumeRole) you use to run the runbook.

To send action output to CloudWatch Logs (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Automation**.
3. Choose the **Preferences** tab, and then choose **Edit**.
4. Select the check box next to **Send output to CloudWatch Logs**.
5. (Recommended) Select the check box next to **Encrypt log data**. With this option turned on, log data is encrypted using the server-side encryption key specified for the log group. If you don't want to encrypt the log data that is sent to CloudWatch Logs, clear the check box. Clear the check box if encryption isn't allowed on the log group.
6. For **CloudWatch Logs log group**, to specify the existing CloudWatch Logs log group in your AWS account that you want to send action output to, select one of the following:
   - **Send output to the default log group** – If the default log group doesn't exist (`/aws/ssm/automation/executeScript`), Automation creates it for you.
   - **Choose from a list of log groups** – Select a log group that has already been created in your account to store action output.
   - **Enter a log group name** – Enter the name of a log group in the text box that has already been created in your account to store action output.
7. Choose **Save**.

To send action output to CloudWatch Logs (command line)

1. Open your preferred command line tool and run the following command to update the action output destination.

Linux & macOS

```
aws ssm update-service-setting \
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination \
    --setting-value CloudWatch
```

Windows

```
aws ssm update-service-setting ^
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination ^
    --setting-value CloudWatch
```

PowerShell

```
Update-SSMServiceSetting `
    -SettingId "arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination" `
    -SettingValue "CloudWatch"
```

There is no output if the command succeeds.

2. Run the following command to specify the log group you want to send action output to.

Linux & macOS

```
aws ssm update-service-setting \
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name \
    --setting-value my-log-group
```

Windows

```
aws ssm update-service-setting ^
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name ^
    --setting-value my-log-group
```

PowerShell

```
Update-SSMServiceSetting `
    -SettingId "arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name" `
    -SettingValue "my-log-group"
```

There is no output if the command succeeds.

3. Run the following command to view the current service settings for Automation action logging preferences in the current AWS account and AWS Region.

Linux & macOS

```
aws ssm get-service-setting \
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination
```

Windows

```
aws ssm get-service-setting ^
    --setting-id arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination
```

PowerShell

```
Get-SSMServiceSetting `
    -SettingId "arn:aws:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination"
```

The command returns information like the following.

```
{
    "ServiceSetting": {
        "Status": "Customized",
        "LastModifiedDate": 1613758617.036,
        "SettingId": "/ssm/automation/customer-script-log-destination",
        "LastModifiedUser": "arn:aws:sts::123456789012:assumed-role/Administrator/
User_1",
```

```
        "SettingValue": "CloudWatch",
        "ARN": "arn:aws:ssm:us-east-2:123456789012:servicesetting/ssm/automation/
customer-script-log-destination"
    }
}
```

Configuring Amazon CloudWatch Logs for Run Command

When you send a command by using Run Command, a tool in AWS Systems Manager, you can specify where you want to send the command output. By default, Systems Manager returns only the first 24,000 characters of the command output. If you want to view the full details of the command output, you can specify an Amazon Simple Storage Service (Amazon S3) bucket. Or you can specify Amazon CloudWatch Logs. If you specify CloudWatch Logs, Run Command periodically sends all command output and error logs to CloudWatch Logs. You can monitor output logs in near real-time, search for specific phrases, values, or patterns, and create alarms based on the search.

If you configured your managed node to use the AWS Identity and Access Management (IAM) managed policies `AmazonSSMManagedInstanceCore` and `CloudWatchAgentServerPolicy`, then your node requires no additional configuration to send output to CloudWatch Logs. Choose this option if sending commands from the console, or add the `cloud-watch-output-config` section and `CloudWatchOutputEnabled` parameter if using the AWS Command Line Interface (AWS CLI), AWS Tools for Windows PowerShell, or an API operation. The `cloud-watch-output-config` section and `CloudWatchOutputEnabled` parameter are described in more detail later in this topic.

For information about adding policies to an instance profile for EC2 instances, see Configure instance permissions required for Systems Manager. For information about adding policies to a service role for on-premises servers and virtual machines that you plan to use as managed nodes, see Create the IAM service role required for Systems Manager in hybrid and multicloud environments.

If you're using a custom policy on your nodes, update the policy on each node to allow Systems Manager to send output and logs to CloudWatch Logs. Add the following policy objects to your custom policy. For more information about updating an IAM policy, see Editing IAM policies in the *IAM User Guide*.

```
{
    "Effect": "Allow",
```

```
    "Action": "logs:DescribeLogGroups",
    "Resource": "*"
},
{
   "Effect":"Allow",
   "Action":[
      "logs:CreateLogGroup",
      "logs:CreateLogStream",
      "logs:DescribeLogStreams",
      "logs:PutLogEvents"
   ],
   "Resource":"arn:aws:logs:*:*:log-group:/aws/ssm/*"
},
```

Specifying CloudWatch Logs when you send commands

To specify CloudWatch Logs as the output when you send a command from the AWS Management Console, choose **CloudWatch Output** in the **Output options** section. Optionally, you can specify the name of CloudWatch Logs group where you want to send command output. If you don't specify a group name, Systems Manager automatically creates a log group for you. The log group uses the following naming format: `/aws/ssm/`*`SystemsManagerDocumentName`*

If you run commands by using the AWS CLI, specify the `cloud-watch-output-config` section in your command. This section allows you to specify the `CloudWatchOutputEnabled` parameter, and optionally, the `CloudWatchLogGroupName` parameter. Here is an example.

Linux & macOS

```
aws ssm send-command \
    --instance-ids "instance ID" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=echo helloWorld" \
    --cloud-watch-output-config
 "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=log group name"
```

Windows

```
aws ssm send-command ^
    --document-name "AWS-RunPowerShellScript" ^
    --parameters commands=["echo helloWorld"] ^
    --targets "Key=instanceids,Values=an instance ID" ^
```

```
    --cloud-watch-output-config '{"CloudWatchLogGroupName":"log group
name","CloudWatchOutputEnabled":true}'
```

Viewing command output in CloudWatch Logs

As soon as the command starts to run, Systems Manager sends output to CloudWatch Logs in near-real time. The output in CloudWatch Logs uses the following format:

CommandID/*InstanceID*/*PluginID*/stdout

CommandID/*InstanceID*/*PluginID*/stderr

Output from the execution is uploaded every 30 seconds or when the buffer exceeds 200 KB, whichever happens first.

> **Note**
>
> Log streams are only created when output data is available. For example, if there is no error data for an execution, the stderr stream isn't created.

Here is an example of the command output as it is displayed in CloudWatch Logs.

```
Group - /aws/ssm/AWS-RunShellScript
Streams –
1234-567-8910/i-abcd-efg-hijk/AWS-RunPowerShellScript/stdout
24/1234-567-8910/i-abcd-efg-hijk/AWS-RunPowerShellScript/stderr
```

Monitoring Systems Manager events with Amazon EventBridge

Amazon EventBridge is a serverless event bus service that allows you to connect your applications with data from a variety of sources. EventBridge delivers a stream of real-time data from your own applications, software-as-a-service (SaaS) applications, and AWS services and routes that data to targets such as AWS Lambda. You can set up routing rules to determine where to send your data to build application architectures that react in real time to all of your data sources. EventBridge allows you to build event driven architectures, which are loosely coupled and distributed.

EventBridge was formerly called Amazon CloudWatch Events. EventBridge includes new features that allow you to receive events from SaaS partners and your own applications.

Existing CloudWatch Events users can access their existing default bus, rules, and events in the new EventBridge console and in the CloudWatch Events console. EventBridge uses the same CloudWatch Events API, so all of your existing CloudWatch Events API usage remains the same.

EventBridge can add events from dozens of AWS services to your rules, and targets from over 20 AWS services.

EventBridge provides support for both AWS Systems Manager events and Systems Manager targets.

Supported Systems Manager event types

Among the many types of Systems Manager events that EventBridge can detect are:

- A just-in-time node access request status update for manual approvals.
- A failed just-in-time node access request.
- A maintenance window being turned off.
- An Automation workflow completing successfully. Automation is a tool in AWS Systems Manager.
- A managed node being out of patch compliance.
- A parameter value being updated.

EventBridge supports events from the following AWS Systems Manager tools:

- Just-in-time node access (Events are emitted on a best effort basis.)
- Automation (Events are emitted on a best effort basis.)
- Change Calendar (Events are emitted on a best effort basis.)
- Compliance
- Inventory (Events are emitted on a best effort basis.)
- Maintenance Windows (Events are emitted on a best effort basis.)
- Parameter Store (Events are emitted on a best effort basis.)
- Run Command (Events are emitted on a best effort basis.)
- State Manager (Events are emitted on a best effort basis.)

For complete details about supported Systems Manager event types, see Reference: Amazon EventBridge event patterns and types for Systems Manager and Amazon EventBridge event examples for Systems Manager.

Supported Systems Manager target types

EventBridge supports the following three Systems Manager tools as targets of an event rule:

- Running an Automation workflow
- Running a Run Command Command document (Events are emitted on a best effort basis.)
- Creating an OpsCenter OpsItem

For suggested ways you might use these targets, see Sample scenarios: Systems Manager targets in Amazon EventBridge rules.

For more information about how to get started with EventBridge and set up rules, see Getting started with Amazon EventBridge in the *Amazon EventBridge User Guide*. For complete information about working with EventBridge, see the *Amazon EventBridge User Guide*.

Topics

- Configuring EventBridge for Systems Manager events
- Amazon EventBridge event examples for Systems Manager
- Sample scenarios: Systems Manager targets in Amazon EventBridge rules

Configuring EventBridge for Systems Manager events

You can use Amazon EventBridge to perform a target event when supported AWS Systems Manager status changes, state changes, or other conditions occur. You can create a rule that runs whenever there is a state or status transition, or when there is a transition to one or more states that are of interest.

The following procedure provides general steps for creating an EventBridge rule that engages when a specified event is emitted by Systems Manager. For a list of procedures in this user guide that address specific scenarios, see **More info** at the end of this topic.

> **Note**
>
> When a service in your AWS account emits an event, it always goes to your account's default event bus. To write a rule that responds to events from AWS services in your account, associate it with the default event bus. You can create a rule on a custom event bus that looks for events from AWS services, but this rule only engages when you receive

such an event from another account through cross-account event delivery. For more information, see Sending and receiving Amazon EventBridge events between AWS accounts in the *Amazon EventBridge User Guide*.

To configure EventBridge for Systems Manager events

1. Open the Amazon EventBridge console at https://eusc-de-east-1.console.amazonaws-eusc.eu/events/.
2. In the navigation pane, choose **Rules**.
3. Choose **Create rule**.
4. Enter a name and description for the rule.

   A rule can't have the same name as another rule in the same AWS Region and on the same event bus.
5. For **Event bus**, choose the event bus that you want to associate with this rule. If you want this rule to respond to matching events that come from your own AWS account, select **default**. When an AWS service in your account emits an event, it always goes to your account's default event bus.
6. For **Rule type**, choose **Rule with an event pattern**.
7. Choose **Next**.
8. For **Event source**, choose **AWS events or EventBridge partner events**.
9. In the **Event pattern** section, choose **Event pattern form**.
10. For **Event source**, choose **AWS services**.
11. For **AWS service**, choose **Systems Manager**.
12. For **Event type**, do one of the following:

    - Choose **All Events**.

      If you choose **All Events**, all events emitted by Systems Manager will match the rule. Be aware that this option can result in many event target actions.
    - Choose the type of Systems Manager event to use for this rule. EventBridge supports events from the following AWS Systems Manager tools:
      - Automation
      - Change Calendar

- Compliance
- Inventory
- Maintenance Windows
- Parameter Store
- Run Command
- State Manager

> **Note**
>
> For Systems Manager actions that aren't supported by EventBridge, you can choose an AWS API call through CloudTrail to create an event rule that is based on an API call, which are recorded by CloudTrail. For an example, see Monitoring session activity using Amazon EventBridge (console).

13. (Optional) To make the rule more specific, add filter values. For example, if you chose **State Manager** and want to limit the rule to the state of a single managed instance that is targeted by an Association, for **Specific type(s)**, choose **EC2 State Manager Instance Association State Change**.

    For complete details about supported detail types, see Reference: Amazon EventBridge event patterns and types for Systems Manager.

    Some detail types have other supported options such as status. The available options depend on the tool you selected.
14. Choose **Next**.
15. For **Target types**, choose **AWS service**.
16. For **Select a target**, choose a target such as an Amazon SNS topic or AWS Lambda function. The target is triggered when an event is received that matches the event pattern defined in the rule.
17. For many target types, EventBridge needs permissions to send events to the target. In these cases, EventBridge can create the AWS Identity and Access Management (IAM) role needed for your rule to run:

    - To create an IAM role automatically, choose **Create a new role for this specific resource**.
    - To use an IAM role that you created earlier, choose **Use existing role**.
18. (Optional) Choose **Add another target** to add another target for this rule.

19. Choose **Next**.
20. (Optional) Enter one or more tags for the rule. For more information, see Amazon EventBridge tags in the *Amazon EventBridge User Guide*.
21. Choose **Next**.
22. Review the details of the rule and choose **Create rule**.

AWS Systems Manager Change Calendar Events

Use the information in this topic to plan and understand the behavior of EventBridge events for AWS Systems Manager Change Calendar.

> **Note**
>
> State changes for calendars shared from other AWS accounts are not currently supported.

Change Calendar integration with Amazon EventBridge

AWS Systems Manager Change Calendar integrates with Amazon EventBridge to notify you of calendar state changes. Be aware of the following behaviors related to the underlying scheduling architecture:

Event timing and reliability

- EventBridge delivers notifications on a best-effort basis with up to a 15-minute scheduling tolerance.
- State change events reflect overall calendar status transitions, not individual calendar events.
- When multiple calendar events occur simultaneously, EventBridge generates only one event per actual calendar state change.
- EventBridge triggers events only when the calendar's overall state transitions (for example, from CLOSED to OPEN), not for individual calendar events that don't result in a state change.
- Advisory events that don't modify the calendar state don't trigger EventBridge notifications.

Event modifications and timing considerations

- If you modify calendar events within 15 minutes of their scheduled start or end time, EventBridge might generate duplicate notifications or miss notifications.
- This behavior occurs because the scheduling system might not have sufficient time to properly update or cancel previously scheduled notifications.

- For recurring events, this behavior typically affects only the first occurrence after modification.

Adjacent and overlapping events

- When calendar events are scheduled within 5 minutes of each other, state transition events might or might not occur, depending on the actual state change.
- Creating overlapping events in certain orders might generate additional EventBridge events even when no actual state change occurs.
- To ensure predictable behavior, avoid creating or modifying calendar events close to their execution times.

Best practices

- Design your EventBridge rules and downstream automation to handle potential duplicate events.
- Implement idempotency in your automation workflows to prevent issues from duplicate notifications.
- Allow sufficient lead time (at least 15 minutes) when you create or modify calendar events.
- Test your EventBridge integrations thoroughly with your specific calendar event patterns.

Calendar OPEN

```

   }
}
```

Sample scenarios: Systems Manager targets in Amazon EventBridge rules

When you specify the target to invoke in an Amazon EventBridge rule, you can choose from over 20 target types and add up to five targets to each rule.

Of the various targets, you can choose from Automation, OpsCenter, and Run Command, which are tools in AWS Systems Manager, as target actions when an EventBridge event occurs.

The following are several examples of ways you can use these tools as the target of an EventBridge rule.

Automation examples

You can configure an EventBridge rule to start Automation workflows when events such as the following occur:

- When an Amazon CloudWatch alarm reports that a managed node has failed a status check (`StatusCheckFailed_Instance=1`), run the `AWSSupport-ExecuteEC2Rescue` Automation runbook on the node.
- When an `EC2 Instance State-change Notification` event occurs because a new Amazon Elastic Compute Cloud (Amazon EC2) instance is running, run the `AWS-AttachEBSVolume` Automation runbook on the instance.
- When an Amazon Elastic Block Store (Amazon EBS) volume is created and available, run the `AWS-CreateSnapshot` Automation runbook on the volume.

OpsCenter examples

You can configure an EventBridge rule to create a new OpsItem when incidents such as the following occur:

- A throttling event for Amazon DynamoDB occurs, or Amazon EBS volume performance has degraded.
- An Amazon EC2 Auto Scaling group fails to launch a node, or a Systems Manager Automation workflow fails.
- An EC2 instance changes state from `Running` to `Stopped`.

Run Command examples

You can configure an EventBridge rule to run a Systems Manager Command document in Run Command when events such as the following occur:

- When an Auto Scaling group is about to end, a Run Command script could capture the log files from the node before it is ended.

- When a new node is created in an Auto Scaling group, a Run Command target action could turn on the web server role or install software on the node.
- When a managed node is found to be out of compliance, a Run Command target action could update patches on the node by running the `AWS-RunPatchBaseline` document.

Monitoring Systems Manager status changes using Amazon SNS notifications

You can configure Amazon Simple Notification Service (Amazon SNS) to send notifications about the status of commands that you send using Run Command or Maintenance Windows, which are tools in AWS Systems Manager. Amazon SNS coordinates and manages sending and delivering notifications to clients or endpoints that are subscribed to Amazon SNS topics. You can receive a notification whenever a command changes to a new state or to a specific state, such as *Failed* or *Timed Out*. In cases where you send a command to multiple nodes, you can receive a notification for each copy of the command sent to a specific node. Each copy is called an *invocation*.

Amazon SNS can deliver notifications as HTTP or HTTPS POST, email (SMTP, either plaintext or in JSON format), or as a message posted to an Amazon Simple Queue Service (Amazon SQS) queue. For more information, see What is Amazon SNS in the *Amazon Simple Notification Service Developer Guide*. For examples of the structure of the JSON data included in the Amazon SNS notification provided by Run Command and Maintenance Windows, see Example Amazon SNS notifications for AWS Systems Manager.

Important

Note the following important information.

- Amazon Simple Notification Service FIFO topics aren't supported.
- Amazon Q Developer in chat applications isn't supported for monitoring Systems Manager with Amazon SNS. If you wish to use Amazon Q Developer in chat applications to monitor Systems Manager, you must use it with Amazon EventBridge. For information about monitoring Systems Manager using EventBridge, see Monitoring Systems Manager events with Amazon EventBridge. For information about Amazon EventBridge and Amazon Q Developer in chat applications, see Tutorial: Creating an EventBridge rule that sends notifications to Amazon Q Developer in chat applications in the *Amazon Q Developer in chat applications Administrator Guide*.

Configure Amazon SNS notifications for AWS Systems Manager

Run Command and Maintenance Windows tasks that are registered to a maintenance window can send Amazon SNS notifications for command tasks that enter the following statuses:

- In Progress
- Success
- Failed
- Timed Out
- Cancelled

For information about the conditions that cause a command to enter one of these statuses, see Understanding command statuses.

> **Note**
>
> Commands sent using Run Command also report Canceling and Pending status. These statuses aren't captured by Amazon SNS notifications.

Command summary Amazon SNS notifications

If you configure Run Command or a Run Command task in your maintenance window for Amazon SNS notifications, Amazon SNS sends summary messages that include the following information.

Field	Type	Description
eventTime	String	The time that the event was initiated. The timestamp is important because Amazon SNS doesn't guarantee message delivery order. Example: 2016-04-26T13:15:30Z

Field	Type	Description
documentName	String	The name of the SSM document used to run this command.
commandId	String	The ID generated by Run Command after the command was sent.
expiresAfter	Date	If this time is reached and the command hasn't already started executing, it won't run.
outputS3BucketName	String	The Amazon Simple Storage Service (Amazon S3) bucket where the responses to the command execution should be stored.
outputS3KeyPrefix	String	The Amazon S3 directory path inside the bucket where the responses to the command execution should be stored.
requestedDateTime	String	The time and date that the request was sent to this specific node.

Field	Type	Description
instanceIds	StringList	The nodes that were targeted by the command. **Note** Instance IDs are only included in the summary message if the Run Command task targeted instance IDs directly. Instance IDs aren't included in the summary message if the Run Command task was issued using tag-based targeting.
status	String	Command status for the command.

Invocation-based Amazon SNS notifications

If you send a command to multiple nodes, Amazon SNS can send messages about each copy or invocation of the command. The messages include the following information.

Field	Type	Description
eventTime	String	The time that the event was initiated. The timestamp is important because Amazon SNS doesn't guarantee message delivery order. Example: 2016-04-26T13:15:30Z

Field	Type	Description
documentName	String	The name of the Systems Manager document (SSM document) used to run this command.
requestedDateTime	String	The time and date that the request was sent to this specific node.
commandId	String	The ID generated by Run Command after the command was sent.
instanceId	String	The instance that was targeted by the command.
status	String	Command status for this invocation.

To set up Amazon SNS notifications when a command changes status, complete the following tasks.

> **Note**
>
> If you aren't configuring Amazon SNS notifications for your maintenance window, then you can skip Task 5 later in this topic.

Topics

- Task 1: Create and subscribe to an Amazon SNS topic
- Task 2: Create an IAM policy for Amazon SNS notifications
- Task 3: Create an IAM role for Amazon SNS notifications
- Task 4: Configure user access
- Task 5: Attach the iam:PassRole policy to your maintenance window role

Task 1: Create and subscribe to an Amazon SNS topic

An Amazon SNS *topic* is a communication channel that Run Command and Run Command tasks that are registered to a maintenance window use to send notifications about the status of your commands. Amazon SNS supports different communication protocols, including HTTP/S, email, and other AWS services like Amazon Simple Queue Service (Amazon SQS). To get started, we recommend that you start with the email protocol. For information about how to create a topic, see Creating an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

> **Note**
>
> After you create the topic, copy or make a note of the **Topic ARN**. You specify this ARN when you send a command that is configured to return status notifications.

After you create the topic, subscribe to it by specifying an **Endpoint**. If you chose the Email protocol, the endpoint is the email address where you want to receive notifications. For more information about how to subscribe to a topic, see Subscribing to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

Amazon SNS sends a confirmation email from *AWS Notifications* to the email address that you specify. Open the email and choose the **Confirm subscription** link.

You will receive an acknowledgement message from AWS. Amazon SNS is now configured to receive notifications and send the notification as an email to the email address that you specified.

Task 2: Create an IAM policy for Amazon SNS notifications

Use the following procedure to create a custom AWS Identity and Access Management (IAM) policy that provides permissions for inititating Amazon SNS notifications.

To create a custom IAM policy for Amazon SNS notifications

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**, and then choose **Create Policy**. (If a **Get Started** button is shown, choose it, and then choose **Create Policy**.)
3. Choose the **JSON** tab.
4. Replace the default content with one of the following, depending on whether the Amazon SNS topic uses AWS KMS encryption:

SNS topic not encrypted

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sns:Publish"
            ],
            "Resource": "arn:aws:sns:us-east-1:111122223333:sns-topic-
name"
        }
    ]
}
```

region represents the identifier for an AWS Region supported by AWS Systems Manager, such as `us-east-2` for the US East (Ohio) Region. For a list of supported *region* values, see the **Region** column in Systems Manager service endpoints in the *Amazon Web Services General Reference*.

account-id represents the 12-digit identifier for your AWS account, in the format `123456789012`.

sns-topic-name represents the name of the Amazon SNS topic you want to use for publishing notifications.

SNS topic encrypted

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
```

```
                "sns:Publish"
            ],
            "Resource": "arn:aws:sns:us-east-1:111122223333:sns-topic-
name"
        },
        {

id"
        }
    ]
}
```

region represents the identifier for an AWS Region supported by AWS Systems Manager, such as us-east-2 for the US East (Ohio) Region. For a list of supported *region* values, see the **Region** column in Systems Manager service endpoints in the *Amazon Web Services General Reference*.

account-id represents the 12-digit identifier for your AWS account, in the format 123456789012.

sns-topic-name represents the name of the Amazon SNS topic you want to use for publishing notifications.

kms-key-id represents the ID of the symmetric encryption KMS key in AWS KMS to use for encrypting and decrypting the topic, in the format 1234abcd-12ab-34cd-56ef-12345EXAMPLE.

> **Note**
>
> There is a charge for using AWS KMS encryption. For more information, see Managing Amazon SNS encryption keys and costs in the *AWS Key Management Service Developer Guide*.

5. Choose **Next: Tags**.

6. (Optional) Add one or more tag-key value pairs to organize, track, or control access for this policy.
7. Choose **Next: Review**.
8. On the **Review policy** page, for **Name**, enter a name for the inline policy. For example: **`my-sns-publish-permissions`**.
9. (Optional) For **Description**, enter a description for the policy.
10. Choose **Create policy**.

Task 3: Create an IAM role for Amazon SNS notifications

Use the following procedure to create an IAM role for Amazon SNS notifications. This service role is used by Systems Manager to initiate Amazon SNS notifications. In all subsequent procedures, this role is referred to as the Amazon SNS IAM role.

To create an IAM service role for Amazon SNS notifications

1. Sign in to the AWS Management Console and open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
3. Choose the **AWS service** role type, and then choose Systems Manager.
4. Choose the Systems Manager use case. Then, choose **Next**.
5. On the **Attach permissions policies** page, select the box to the left of the name of the custom policy you created in Task 2. For example: **`my-sns-publish-permissions`**.
6. (Optional) Set a permissions boundary. This is an advanced feature that is available for service roles, but not service-linked roles.

   Expand the **Permissions boundary** section and choose **Use a permissions boundary to control the maximum role permissions**. IAM includes a list of the AWS managed and customer managed policies in your account. Select the policy to use for the permissions boundary or choose **Create policy** to open a new browser tab and create a new policy from scratch. For more information, see Creating IAM policies in the *IAM User Guide*. After you create the policy, close that tab and return to your original tab to select the policy to use for the permissions boundary.
7. Choose **Next**.

8. If possible, enter a role name or role name suffix to help you identify the purpose of this role. Role names must be unique within your AWS account. They are not distinguished by case. For example, you cannot create roles named both **PRODROLE** and **prodrole**. Because various entities might reference the role, you cannot edit the name of the role after it has been created.
9. (Optional) For **Description**, enter a description for the new role.
10. Choose **Edit** in the **Step 1: Select trusted entities** or **Step 2: Select permissions** sections to edit the use cases and permissions for the role.
11. (Optional) Add metadata to the user by attaching tags as key-value pairs. For more information about using tags in IAM, see Tagging IAM resources in the *IAM User Guide*.
12. Review the role and then choose **Create role**.
13. Choose the name of the role, and then copy or make a note of the **Role ARN** value. This Amazon Resource Name (ARN) for the role is used when you send a command that is configured to return Amazon SNS notifications.
14. Keep the **Summary** page open.

Task 4: Configure user access

If an IAM entity (user, role, or group) is assigned administrator permissions, then the user or role has access to Run Command and Maintenance Windows, tools in AWS Systems Manager.

For entities without administrator permissions, an administrator must grant the following permissions to the IAM entity:

- The `AmazonSSMFullAccess` managed policy, or a policy that provides comparable permissions.
- `iam:PassRole` permissions for the role created in Task 3: Create an IAM role for Amazon SNS notifications. For example:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::111122223333:role/sns-role-name",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "ssm.amazonaws.eu"
                }
            }
        }
    ]
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

To configure user access and attach the `iam:PassRole` policy to a user account

1. In the IAM navigation pane, choose **Users**, and then choose the user account that you want to configure.
2. On the **Permissions** tab, in the policies list, verify that either the **`AmazonSSMFullAccess`** policy is listed or that there is a comparable policy that gives the account permissions to access Systems Manager.
3. Choose **Add inline policy**.
4. On the **Create policy** page, choose the **Visual editor** tab.
5. Choose **Choose a service**, and then choose **IAM**.

6. For **Actions**, in the **Filter actions** text box, enter **`PassRole`**, and then select the check box next to **PassRole**.
7. For **Resources**, verify that **Specific** is selected, and then choose **Add ARN**.
8. In the **Specify ARN for role** field, paste the Amazon SNS IAM role ARN that you copied at the end of Task 3. The system automatically populates the **Account** and **Role name with path** fields.
9. Choose **Add**.
10. Choose **Review policy**.
11. On the **Review Policy** page, enter a name and then choose **Create policy**.

Task 5: Attach the iam:PassRole policy to your maintenance window role

When you register a Run Command task with a maintenance window, you specify a service role Amazon Resource Name (ARN). This service role is used by Systems Manager to run tasks registered to the maintenance window. To configure Amazon SNS notifications for a registered Run Command task, attach an `iam:PassRole` policy to the maintenance window service role specified. If you don't intend to configure the registered task for Amazon SNS notifications, then you can skip this task.

The `iam:PassRole` policy allows the Maintenance Windows service role to pass the Amazon SNS IAM role created in Task 3 to the Amazon SNS service. The following procedure shows how to attach the `iam:PassRole` policy to the Maintenance Windows service role.

> **Note**
>
> Use a custom service role for your maintenance window to send notifications related to the Run Command tasks registered. For information, see Setting up Maintenance Windows. If you need to create a custom service role for maintenance window tasks, see Setting up Maintenance Windows.

To attach the `iam:PassRole` policy to your Maintenance Windows role

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles** and select the Amazon SNS IAM role created in Task 3.
3. Copy or make a note of the **Role ARN** and return to the **Roles** section of the IAM console.

4. Select the custom Maintenance Windows service role you created from the **Role name** list.
5. On the **Permissions** tab, verify that either the `AmazonSSMMaintenanceWindowRole` policy is listed or there is a comparable policy that gives maintenance windows permission to the Systems Manager API. If it is not, choose **Add permissions, Attach policies** to attach it.
6. Choose **Add permissions, Create inline policy**.
7. Choose the **Visual editor** tab.
8. For **Service**, choose **IAM**.
9. For **Actions**, in the **Filter actions** text box, enter **`PassRole`**, and then select the check box next to **PassRole**.
10. For **Resources**, choose **Specific**, and then choose **Add ARN**.
11. In the **Specify ARN for role** box, paste the ARN of the Amazon SNS IAM role created in Task 3, and then choose **Add**.
12. Choose **Review policy**.
13. On the **Review policy** page, specify a name for the `PassRole` policy, and then choose **Create policy**.

Example Amazon SNS notifications for AWS Systems Manager

You can configure Amazon Simple Notification Service (Amazon SNS) to send notifications about the status of commands that you send using Run Command or Maintenance Windows, which are tools in AWS Systems Manager.

> **Note**
>
> This guide doesn't address how to configure notifications for Run Command or Maintenance Windows. For information about configuring Run Command or Maintenance Windows to send Amazon SNS notifications about the status of commands, see Configure Amazon SNS notifications for AWS Systems Manager.

The following examples show the structure of the JSON output returned by Amazon SNS notifications when configured for Run Command or Maintenance Windows.

Sample JSON Output for Command summary messages using instance ID targeting

```
{
    "commandId": "a8c7e76f-15f1-4c33-9052-0123456789ab",
    "documentName": "AWS-RunPowerShellScript",
    "instanceIds": [
        "i-1234567890abcdef0",
        "i-9876543210abcdef0"
    ],
    "requestedDateTime": "2019-04-25T17:57:09.17Z",
    "expiresAfter": "2019-04-25T19:07:09.17Z",
    "outputS3BucketName": "amzn-s3-demo-bucket",
    "outputS3KeyPrefix": "runcommand",
    "status": "InProgress",
    "eventTime": "2019-04-25T17:57:09.236Z"
}
```

Sample JSON Output for Command summary messages using tag-based targeting

```
{
    "commandId": "9e92c686-ddc7-4827-b040-0123456789ab",
    "documentName": "AWS-RunPowerShellScript",
    "instanceIds": [],
    "requestedDateTime": "2019-04-25T18:01:03.888Z",
    "expiresAfter": "2019-04-25T19:11:03.888Z",
    "outputS3BucketName": "",
    "outputS3KeyPrefix": "",
    "status": "InProgress",
    "eventTime": "2019-04-25T18:01:05.825Z"
}
```

Sample JSON Output for Invocation messages

```
{
    "commandId": "ceb96b84-16aa-4540-91e3-925a9a278b8c",
    "documentName": "AWS-RunPowerShellScript",
    "instanceId": "i-1234567890abcdef0",
    "requestedDateTime": "2019-04-25T18:06:05.032Z",
    "status": "InProgress",
    "eventTime": "2019-04-25T18:06:05.099Z"
}
```

Use Run Command to send a command that returns status notifications

The following procedures show how to use the AWS Command Line Interface (AWS CLI) or AWS Systems Manager console to send a command through Run Command, a tool in AWS Systems Manager, that is configured to return status notifications.

Sending a Run Command that returns notifications (console)

Use the following procedure to send a command through Run Command that is configured to return status notifications using the Systems Manager console.

To send a command that returns notifications (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose a Systems Manager document.
5. In the **Command parameters** section, specify values for required parameters.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:
   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.
8. For **Rate control**:
   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS Notifications** section, choose **Enable SNS notifications**.
11. For **IAM role**, choose the Amazon SNS IAM role ARN you created in Task 3 in Monitoring Systems Manager status changes using Amazon SNS notifications.
12. For **SNS topic**, enter the Amazon SNS topic ARN to be used.
13. For **Event notifications**, choose the events for which you want to receive notifications.
14. For **Change notifications**, choose to receive notifications for the command summary only (**Command status changes**) or for each copy of a command sent to multiple nodes (**Command status on each instance changes**) .
15. Choose **Run**.

16. Check your email for a message from Amazon SNS and open the email message. Amazon SNS can take several minutes to send the email message.

Sending a Run Command that returns notifications (CLI)

Use the following procedure to send a command through Run Command that is configured to return status notifications using the AWS CLI.

To send a command that returns notifications (CLI)

1. Open the AWS CLI.
2. Specify parameters in the following command to target based on managed node IDs.

```
aws ssm send-command --instance-ids "ID-1, ID-2" --document-name "Name"
 --parameters '{"commands":["input"]}' --service-role "SNSRoleARN" --
notification-config '{"NotificationArn":"SNSTopicName","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Following is an example.

```
aws ssm send-command --instance-ids "i-02573cafcfEXAMPLE, i-0471e04240EXAMPLE"
 --document-name "AWS-RunPowerShellScript" --parameters '{"commands":
["Get-Process"]}' --service-role "arn:aws:iam::111122223333:role/
SNS_Role" --notification-config '{"NotificationArn":"arn:aws:sns:us-
east-1:111122223333:SNSTopic","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Alternative commands

Specify parameters in the following command to target managed instances using tags.

```
aws ssm send-command --targets "Key=tag:TagName,Values=TagKey" --document-name
 "Name" --parameters '{"commands":["input"]}' --service-role "SNSRoleARN" --
notification-config '{"NotificationArn":"SNSTopicName","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Following is an example.

```
aws ssm send-command --targets "Key=tag:Environment,Values=Dev" --
document-name "AWS-RunPowerShellScript" --parameters '{"commands":
["Get-Process"]}' --service-role "arn:aws:iam::111122223333:role/
SNS_Role" --notification-config '{"NotificationArn":"arn:aws:sns:us-
east-1:111122223333:SNSTopic","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

3. Press **Enter**.
4. Check your email for a message from Amazon SNS and open the email message. Amazon SNS can take several minutes to send the email message.

For more information, see send-command in the *AWS CLI Command Reference*.

Use a maintenance window to send a command that returns status notifications

The following procedures show how to register a Run Command task with your maintenance window using the AWS Systems Manager console or the AWS Command Line Interface (AWS CLI). Run Command is a tool in AWS Systems Manager. The procedures also describe how to configure the Run Command task to return status notifications.

Before you begin

If you haven't created a maintenance window or registered targets, see Create and manage maintenance windows using the console for steps on how to create a maintenance window and register targets.

To receive notifications from the Amazon Simple Notification Service (Amazon SNS) service, attach an `iam:PassRole` policy to the Maintenance Windows service role specified in the registered task. If you haven't added `iam:PassRole` permissions to your Maintenance Windows service role, see Task 5: Attach the iam:PassRole policy to your maintenance window role.

Registering a Run Command task to a maintenance window that returns notifications (console)

Use the following procedure to register a Run Command task that is configured to return status notifications to your maintenance window using the Systems Manager console.

To register a Run Command task with your maintenance window that returns notifications (console)

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Maintenance Windows**.
3. Select the maintenance window for which you would like to register a Run Command task configured to send Amazon Simple Notification Service (Amazon SNS) notifications.
4. Choose **Actions** and then choose **Register Run command task**.
5. (Optional) In the **Name** field, enter a name for the task.
6. (Optional) In the **Description** field, enter a description.
7. For **Command document**, choose a Command document.
8. For **Task priority**, specify a priority for this task. Zero (`0`) is the highest priority. Tasks in a maintenance window are scheduled in priority order. Tasks that have the same priority are scheduled in parallel.
9. In the **Targets** section, select a registered target group or select unregistered targets.
10. For **Rate control**:

    - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

      > **Note**
      >
      > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

    - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

11. In the **IAM service role** area, choose the Maintenance Windows service role that has `iam:PassRole` permissions to the SNS role.

> **Note**
>
> Add `iam:PassRole` permissions to the Maintenance Windows role to allow Systems Manager to pass the SNS role to Amazon SNS. If you haven't added `iam:PassRole` permissions, see Task 5 in the topic Monitoring Systems Manager status changes using Amazon SNS notifications.

12. (Optional) For **Output options**, to save the command output to a file, select the **Enable writing output to S3** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the managed node, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, verify that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

13. In the **SNS notifications** section, do the following:

    - Choose **Enable SNS Notifications**.
    - For **IAM role**, choose the Amazon SNS IAM role Amazon Resource Name (ARN) you created in Task 3 in Monitoring Systems Manager status changes using Amazon SNS notifications to initiate Amazon SNS.
    - For **SNS topic**, enter the Amazon SNS topic ARN to be used.
    - For **Event type**, choose the events for which you want to receive notifications.
    - For **Notification type**, choose to receive notifications for each copy of a command sent to multiple nodes (invocations) or the command summary.

14. In the **Parameters** section, enter the required parameters based on the Command document you chose.
15. Choose **Register Run command task**.

16. After the next time your maintenance window runs, check your email for a message from Amazon SNS and open the email message. Amazon SNS can take a few minutes to send the email message.

Registering a Run Command task to a maintenance window that returns notifications (CLI)

Use the following procedure to register a Run Command task that is configured to return status notifications to your maintenance window using the AWS CLI.

To register a Run Command task with your maintenance window that returns notifications (CLI)

> **Note**
>
> To better manage your task options, this procedure uses the command option `--cli-input-json`, with option values stored in a JSON file.

1. On your local machine, create a file named `RunCommandTask.json`.
2. Paste the following contents into the file.

```
{
    "Name": "Name",
    "Description": "Description",
    "WindowId": "mw-0c50858d01EXAMPLE",
    "ServiceRoleArn": "arn:aws:iam::account-id:role/MaintenanceWindowIAMRole",
    "MaxConcurrency": "1",
    "MaxErrors": "1",
    "Priority": 3,
    "Targets": [
        {
            "Key": "WindowTargetIds",
            "Values": [
                "e32eecb2-646c-4f4b-8ed1-205fbEXAMPLE"
            ]
        }
    ],
    "TaskType": "RUN_COMMAND",
    "TaskArn": "CommandDocumentName",
    "TaskInvocationParameters": {
```

```
        "RunCommand": {
            "Comment": "Comment",
            "TimeoutSeconds": 3600,
            "NotificationConfig": {
                "NotificationArn": "arn:aws:sns:region:account-id:SNSTopicName",
                "NotificationEvents": [
                    "All"
                ],
                "NotificationType": "Command"
            },
            "ServiceRoleArn": "arn:aws:iam::account-id:role/SNSIAMRole"
        }
    }
}
```

3. Replace the example values with information about your own resources.

   You can also restore options we've omitted from this example if you want to use them. For example, you can save command output to an S3 bucket.

   For more information, see register-task-with-maintenance-window in the *AWS CLI Command Reference*.

4. Save the file.

5. In the directory on your local machine where you saved the file, run the following command.

```
aws ssm register-task-with-maintenance-window --cli-input-json file://
RunCommandTask.json
```

> **Important**
>
> Be sure to include `file://` before the file name. It's required in this command.

If successful, the command returns information similar to the following.

```
{
    "WindowTaskId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

6. After the next execution of your maintenance window, check your email for a message from Amazon SNS and open the email message. Amazon SNS can take a few minutes to send the email message.

For more information about registering tasks for a maintenance window from the command line, see Register tasks with the maintenance window.

Product and service integrations with Systems Manager

By default, AWS Systems Manager integrates with AWS services and other products and services. The following information can help you configure Systems Manager to integrate with the products and services you use.

- Integration with AWS services
- Integration with other products and services

Integration with AWS services

Through the use of Systems Manager Command documents (SSM documents) and Automation runbooks, you can use AWS Systems Manager to integrate with AWS services. For more information about these resources, see AWS Systems Manager Documents.

Systems Manager is integrated with the following AWS services.

Compute

Amazon Elastic Compute Cloud (Amazon EC2)	Amazon EC2 provides scalable computing capacity in the AWS Cloud. Using Amazon EC2 eliminates your need to invest in hardware up front, so you can develop and deploy applications faster. You can use Amazon EC2 to launch as many or as few virtual servers as you need, configure security and networking, and manage storage. Systems Manager allows you to perform several tasks on EC2 instances. For example you can launch, configure, manage, maintain, troubleshoot, and securely connect to your EC2 instances. You can also use Systems Manager to deploy software, determine compliance status, and gather inventory from your EC2 instances.

	Learn more • Working with managed nodes • AWS Systems Manager State Manager • AWS Systems Manager Run Command • AWS Systems Manager Patch Manager • AWS Systems Manager Session Manager • AWS Systems Manager Distributor • AWS Systems Manager Compliance • AWS Systems Manager Inventory
Amazon EC2 Auto Scaling	Auto Scaling helps you ensure that you have the correct number of EC2 instances available to handle the load for your application. You create collections of EC2 instances, called Auto Scaling groups. Systems Manager allows you to automate common procedures like patching the Amazon Machine Image (AMI) used in your Auto Scaling template for your Auto Scaling group. **Learn more** Updating AMIs for Auto Scaling groups

Amazon Elastic Container Service (Amazon ECS)	Amazon ECS is a highly scalable, fast, container management service that allows you to run, stop, and manage Docker containers on a cluster. Systems Manager allows you to manage container instances remotely and inject sensitive data into your containers by storing your sensitive data in parameters in Parameter Store, a tool in Systems Manager, and then referencing them in your container definition. **Learn more** • Manage container instances remotely using AWS Systems Manager • Specifying sensitive data using Systems Manager Parameter Store

AWS Lambda	Lambda is a compute service that allows you to run code without provisioning or managing servers. Lambda runs your code only when needed and scales automatically, from a few requests per day to thousands per second. Systems Manager allows you to use Lambda functions within Automation runbook content by using the `aws:invokeLambdaFunction` action. To use parameters from Parameter Store in AWS Lambda functions, you can use the AWS Parameters and Secrets Lambda Extension to retrieve parameter values and cache them for future use. **Learn more** Update a golden AMI using Automation, AWS Lambda, and Parameter Store Using Parameter Store parameters in AWS Lambda functions

Internet of Things (IoT)

AWS IoT Greengrass core devices	AWS IoT Greengrass is an open source IoT edge runtime and cloud service that helps you build, deploy and manage IoT applications on your devices. Systems Manager offers native support for AWS IoT Greengrass core devices. **Learn more** Managing edge devices with Systems Manager

AWS IoT core devices	AWS IoT provides the cloud services that connect your IoT devices to other devices and AWS cloud services. AWS IoT provides device software that can help you integrate your IoT devices into AWS IoT-based solutions. If your devices can connect to AWS IoT, AWS IoT can connect them to the cloud services that AWS provides. Systems Manager supports AWS IoT core devices as long as those devices are configured as *managed nodes* in a hybrid and multicloud environment. **Learn more** Managing nodes in hybrid and multicloud environments with Systems Manager

Storage

Amazon Simple Storage Service (Amazon S3)	Amazon S3 is storage for the Internet. It's designed to make web-scale computing easier for developers. Amazon S3 has a simple web services interface that you can use to store and retrieve any amount of data, at any time, from anywhere on the web. Systems Manager allows you to run remote scripts and SSM documents that are stored in Amazon S3. Distributor, a tool in AWS Systems Manager, uses Amazon S3 to store packages. You can also send output to Amazon S3 for Run Command and Session Manager, tools in AWS Systems Manager. **Learn more** • Running scripts from Amazon S3

	• Running documents from remote locations • AWS Systems Manager Distributor • Logging session data using Amazon S3 (console)

Developer Tools

AWS CodeBuild	CodeBuild is a fully managed build service in the cloud. CodeBuild compiles your source code, runs unit tests, and produces artifacts that are ready to deploy. CodeBuild eliminates the need to provision, manage, and scale your own build servers. Parameter Store allows you to store sensitive information for your build specifications and projects. **Learn more** • Build specification reference for CodeBuild • Create a build project in AWS CodeBuild
AWS CDK	The AWS Cloud Development Kit (AWS CDK) is a framework for defining cloud infrastructure as code, with programming languages, and deploying it through AWS CloudFormation. Application Manager allows you to view your CDK constructs grouped as applications, view the application structure including the underlying resources, view alerts, investigate and remediate operational issues, and track costs in the Application Manager console.

	Learn more • Viewing overview information about an application • Viewing application resources

Security, Identity, and Compliance

AWS Identity and Access Management (IAM)	IAM is a web service that helps you securely control access to AWS resources. You use IAM to control who is authenticated (signed in) and authorized (has permissions) to use resources. Systems Manager allows you to control access to services using IAM. **Learn more** • How AWS Systems Manager works with IAM • Actions, resources, and condition keys for AWS Systems Manager • Configure instance permissions required for Systems Manager
AWS Secrets Manager	Secrets Manager provides easier managemen t of secrets. Secrets can be database credentia ls, passwords, third-party API keys, and even arbitrary text. Parameter Store allows you to retrieve Secrets Manager secrets when using other AWS services that already support references to Parameter Store parameters. **Learn more**

	Referencing AWS Secrets Manager secrets from Parameter Store parameters

AWS Security Hub CSPM	Security Hub CSPM gives you a comprehen sive view of your high-priority security alerts and compliance status across AWS accounts. Security Hub CSPM aggregates, organizes, and prioritizes your security alerts, or findings, from multiple AWS services. When you turn on integration between Security Hub CSPM and Patch Manager, a tool in AWS Systems Manager, Security Hub CSPM monitors the patching status of your fleets from a security standpoint. Patch compliance details are automatically exported to Security Hub CSPM. This allows you to use a single view to centrally monitor your patch compliance status and to track other security findings. You can receive alerts when nodes in your fleet go out of patch complianc e and review patch compliance findings in the Security Hub CSPM console. You can also integrate Security Hub CSPM with Explorer and OpsCenter, tools in AWS Systems Manager. Integration with Security Hub CSPM allows you to receive findings from Security Hub CSPM in Explorer and OpsCenter . Security Hub CSPM findings provide security information that you can use in Explorer and OpsCenter to aggregate and take action on your security, performance, and operational issues in AWS Systems Manager. There is a charge to use Security Hub CSPM. For more information, see Security Hub CSPM pricing.

	Learn more • Receiving findings from AWS Security Hub CSPM in Explorer • Understanding OpsCenter integration with AWS Security Hub CSPM • Integrating Patch Manager with AWS Security Hub CSPM

Cryptography and PKI

AWS Key Management Service (AWS KMS)	AWS KMS is a managed service that allows you to create and control customer managed keys, the encryption keys used to encrypt your data. Systems Manager allows you to use AWS KMS to create `SecureString` parameters and encrypt Session Manager session data. **Learn more** • AWS KMS encryption for AWS Systems Manager Parameter Store SecureString parameters • Turn on KMS key encryption of session data (console)

Management and Governance

AWS CloudFormation	CloudFormation is a service that helps you model and set up your Amazon Web Services resources so that you can spend less time managing those resources and more time focusing on your applications that run in AWS.

	Parameter Store is a source for dynamic references. Dynamic references provide a compact, powerful way for you to specify external values that are stored and managed in other services in your CloudFormation stack templates. **Learn more** Using dynamic references to specify template values
AWS CloudTrail	CloudTrail is an AWS service that helps you authorize governance, compliance, and operational and risk auditing of your AWS account. Actions taken by a user, role, or an AWS service are recorded as events in CloudTrail. Events include actions taken in the AWS Management Console, AWS Command Line Interface (AWS CLI), and AWS SDKs and APIs. Systems Manager integrates with CloudTrai l which captures most Systems Manager API calls as events. These include API calls initiated from the Systems Manager console and calls made to the Systems Manager APIs. **Learn more** Logging AWS Systems Manager API calls with AWS CloudTrail

Amazon CloudWatch Logs	Amazon CloudWatch Logs allows you to centralize the logs from all of your systems, applications, and AWS services that you use. You can then view them, search them for specific error codes or patterns, filter them based on specific fields, or archive them securely for future analysis. Systems Manager supports sending logs for the SSM Agent, Run Command, and Session Manager to CloudWatch Logs. **Learn more** • Sending node logs to unified CloudWatch Logs (CloudWatch agent) • Configuring Amazon CloudWatch Logs for Run Command • Logging session data using Amazon CloudWatch Logs (console)

Amazon EventBridge	EventBridge delivers a near real-time stream of system events that describes changes in Amazon Web Services resources. Using simple rules that you can quickly set up, you can match events and route them to one or more target functions or streams. EventBridge becomes aware of operational changes as they occur. EventBridge responds to these operational changes and takes corrective action as necessary. These actions include sending messages to respond to the environment, activating functions, and capturing state information. Systems Manager has multiple events that are supported by EventBridge allowing you to take actions based on the content of those events. **Learn more** Monitoring Systems Manager events with Amazon EventBridge **Note** Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBrid ge are the same underlying service and API, but EventBridge provides more features. Changes you make in either CloudWatch or EventBridge are reflected in each console. For more information, see the *Amazon EventBrid ge User Guide*.

AWS Config	AWS Config provides a detailed view of the configuration of AWS resources in your AWS account. This includes how the resources are related to one another and how they were configured. This allows you to see how the configurations and relationships change over time. Systems Manager is integrated with AWS Config, providing multiple rules that help you gain visibility into your EC2 instances. These rules help you identify which EC2 instances are managed by Systems Manager, operating system configurations, system-level updates, installed applications, network configurations, and more. **Learn more** • AWS Config supported resource types • Recording software configuration for managed instances • Viewing inventory history and change tracking
AWS Trusted Advisor	Trusted Advisor is an online tool that provides real-time guidance to help you provision your resources following AWS best practices. Systems Manager hosts Trusted Advisor and you can view Trusted Advisor data in Explorer. **Learn more** • AWS Systems Manager Explorer • Getting started with AWS Trusted Advisor

AWS Organizations	Organizations is an account management service that allows you to consolidate multiple AWS accounts into an organization that you create and centrally manage. Organizations includes account management and consolida ted billing capabilities that allow you to better meet the budgetary, security, and compliance needs of your business. Integration between Change Manager, a tool in AWS Systems Manager, with Organizat ions makes it possible to use a delegated administrator account to manage change requests, change templates, and approvals for your entire organization through this single account. Organizations integration with Inventory, a tool in AWS Systems Manager, and Explorer allows you to aggregate inventory and operations data (OpsData) from multiple AWS Regions and AWS accounts. Integration between Quick Setup , a tool in AWS Systems Manager, and Organizations automates common service setup tasks, and deploys service configurations based on best practices across your organizational units (OUs).

Networking and Content Delivery

AWS PrivateLink	AWS PrivateLink allows you to privately connect your virtual private cloud (VPC) to supported AWS services and VPC endpoint services without requiring an internet

	gateway, NAT device, VPN connection, or Direct Connect connection. Systems Manager supports managed nodes connecting to Systems Manager APIs using AWS PrivateLink. This improves the security posture of your managed nodes because AWS PrivateLink restricts all network traffic between your managed nodes, Systems Manager, and Amazon EC2 to the Amazon network. This means that managed nodes aren't required to have access to the internet. **Learn more** Improve the security of EC2 instances by using VPC endpoints for Systems Manager

Analytics

Amazon Athena	Athena is an interactive query service that allows you to analyze data directly in Amazon Simple Storage Service (Amazon S3) using standard SQL. With a few actions in the AWS Management Console, you can point Athena at your data stored in Amazon S3 and begin using standard SQL to run one-time queries and get results in seconds. Systems Manager Inventory integrates with Athena to help you query inventory data from multiple AWS Regions and AWS accounts. Athena integration uses resource data sync so that you can view inventory data from all managed nodes on the **Detailed View** page in the Systems Manager Inventory console.

	Learn more • Querying inventory data from multiple Regions and accounts • Walkthrough: Using resource data sync to aggregate inventory data
AWS Glue	AWS Glue is a fully managed ETL (extract, transform, and load) service that makes it simple and cost-effective to categorize your data, clean it, enrich it, and move it reliably between various data stores and data streams. Systems Manager uses AWS Glue to crawl the Inventory data in your S3 bucket. **Learn more** Querying inventory data from multiple Regions and accounts
Amazon Quick Suite	Quick Suite is a business analytics service you can use to build visualizations, perform one-time analysis, and get business insights from your data. It can automatically discover AWS data sources and also works with your data sources. Systems Manager resource data sync sends inventory data collected from all of your managed nodes to a single S3 bucket. You can use Quick Suite to query and analyze the aggregated data. **Learn more** • Creating a resource data sync for Inventory • Walkthrough: Using resource data sync to aggregate inventory data

Application Integration

Amazon Simple Notification Service (Amazon SNS)	Amazon SNS is a web service that coordinates and manages the delivery or sending of messages to subscribing endpoints or clients. Systems Manager generates statuses for multiple services that can be captured by Amazon SNS notifications. **Learn more** • Monitoring Systems Manager status changes using Amazon SNS notifications • Setting up notifications or triggering actions based on Parameter Store events

AWS Management Console

AWS Resource Groups	Resource Groups organize your AWS resources. Resource groups make it easier to manage, monitor, and automate tasks on large numbers of resources at one time. Systems Manager resource types like managed nodes, SSM documents, maintenance windows, Parameter Store parameters, and patch baselines can be added to resource groups. **Learn more** What are AWS Resource Groups?

Topics

- Running scripts from Amazon S3

- Referencing AWS Secrets Manager secrets from Parameter Store parameters
- AWS KMS encryption for AWS Systems Manager Parameter Store SecureString parameters
- Use Parameter Store parameters in Amazon Elastic Kubernetes Service
- Using Parameter Store parameters in AWS Lambda functions

Running scripts from Amazon S3

This section describes how to download and run scripts from Amazon Simple Storage Service (Amazon S3). The following topic includes information and terminology relating to Amazon S3. To learn more about Amazon S3, see What is Amazon S3? You can run different types of scripts, including Ansible Playbooks, Python, Ruby, Shell, and PowerShell.

You can also download a directory that includes multiple scripts. When you run the primary script in the directory, AWS Systems Manager also runs any referenced scripts that are included in the directory.

Note the following important details about running scripts from Amazon S3:

- Systems Manager doesn't verify that your script is capable of running on an node. Before you download and run the script, verify that the required software is installed on the node. Or, you can create a composite document that installs the software by using either Run Command or State Manager, tools in AWS Systems Manager, and then downloads and runs the script.
- Verify that your user, role, or group has been granted the AWS Identity and Access Management (IAM) permissions needed to read from the S3 bucket.
- Ensure that the instance profile on your Amazon Elastic Compute Cloud (Amazon EC2) instances has `s3:ListBucket` and `s3:GetObject` permissions. If the instance profile doesn't have these permissions, the system fails to download your script from the S3 bucket. For more information, see Using instance profiles in the *IAM User Guide*.

Run shell scripts from Amazon S3

This following information includes procedures to help you run scripts from Amazon Simple Storage Service (Amazon S3) by using either the AWS Systems Manager console or the AWS Command Line Interface (AWS CLI). Though shell scripts are used in the examples, other types of scripts can be substituted.

Run a shell script from Amazon S3 (console)

Run a shell script from Amazon S3

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **`AWS-RunRemoteScript`**.
5. In **Command parameters**, do the following:

   - In **Source Type**, select **S3**.
   - In the **Source Info** text box, enter the required information to access the source in the following format. Replace each *`example resource placeholder`* with your own information.

     > **Note**
     >
     > Replace https://s3.*`aws-api-domain`* with the URL for your bucket. You can copy your bucket URL in Amazon S3 on the **Objects** tab.

     ```
     {"path":"https://s3.aws-api-domain/path to script"}
     ```

     The following is an example.

     ```
     {"path":"https://amzn-s3-demo-bucket.s3.us-east-2.amazonaws.com/scripts/shell/
     helloWorld.sh"}
     ```

   - In the **Command Line** field, enter parameters for the script execution. Here is an example.

     ```
     helloWorld.sh argument-1 argument-2
     ```

   - (Optional) In the **Working Directory** field, enter the name of a directory on the node where you want to download and run the script.
   - (Optional) In **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.

6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more

information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run a shell script from Amazon S3 (command line)

1. Install and configure the AWS Command Line Interface (AWS CLI), if you haven't already.

   For information, see Installing or updating the latest version of the AWS CLI.

2. Run the following command. Replace each *example resource placeholder* with your own information.

   Note

   Replace https://s3.*aws-api-domain*/*script path* with the URL for your bucket. You can copy your bucket URL in Amazon S3 on the **Objects** tab.

   Linux & macOS

```
aws ssm send-command \
    --document-name "AWS-RunRemoteScript" \
    --output-s3-bucket-name "amzn-s3-demo-bucket" \
    --output-s3-key-prefix "key-prefix" \
    --targets "Key=InstanceIds,Values=instance-id" \
    --parameters '{"sourceType":["S3"],"sourceInfo":["{\"path\":\"https://
s3.aws-api-domain/script path\"}"],"commandLine":["script name and arguments"]}'
```

Windows

```
aws ssm send-command ^
    --document-name "AWS-RunRemoteScript" ^
    --output-s3-bucket-name "amzn-s3-demo-bucket" ^
    --output-s3-key-prefix "key-prefix" ^
    --targets "Key=InstanceIds,Values=instance-id" ^
    --parameters "sourceType"="S3",sourceInfo='{\"path\":\"https://s3.aws-api-domain/script path\"}',"commandLine"="script name and arguments"
```

PowerShell

```
Send-SSMCommand `
    -DocumentName "AWS-RunRemoteScript" `
    -OutputS3BucketName "amzn-s3-demo-bucket" `
    -OutputS3KeyPrefix "key-prefix" `
    -Target @{Key="InstanceIds";Values=@("instance-id")} `
    -Parameter @{
        sourceType = "S3";
        sourceInfo = '{"path": "s3://bucket-name/path/to/script"}';
        commandLine = "script name and arguments"
    }
```

Referencing AWS Secrets Manager secrets from Parameter Store parameters

AWS Secrets Manager helps you organize and manage important configuration data such as credentials, passwords, and license keys. Parameter Store, a tool in AWS Systems Manager, is integrated with Secrets Manager so that you can retrieve Secrets Manager secrets when using other AWS services that already support references to Parameter Store parameters. These services include Amazon Elastic Compute Cloud (Amazon EC2), Amazon Elastic Container Service (Amazon ECS), AWS Lambda, CloudFormation, AWS CodeBuild, AWS CodeDeploy, and other Systems Manager tools. By using Parameter Store to reference Secrets Manager secrets, you create a consistent and secure process for calling and using secrets and reference data in your code and configuration scripts.

For more information about Secrets Manager, see What Is AWS Secrets Manager? in the *AWS Secrets Manager User Guide*.

Restrictions

Note the following restrictions when using Parameter Store to reference Secrets Manager secrets:

- You can only retrieve Secrets Manager secrets by using the GetParameter and GetParameters API operations. Modification operations and advance querying API operations, such as DescribeParameters and GetParametersByPath, aren't supported for Secrets Manager.
- You can use the AWS Command Line Interface (AWS CLI), AWS Tools for Windows PowerShell, and the SDKs to retrieve a secret by using Parameter Store.
- Secrets Manager secrets in Parameter Store must have a prefix of `/aws/reference/secretsmanager`. The following are examples:

  ```
  /aws/reference/secretsmanager/CFCreds1
  ```

  ```
  /aws/reference/secretsmanager/myapp/db/password
  ```

- Parameter Store honors AWS Identity and Access Management (IAM) policies attached to Secrets Manager secrets. For example, if User 1 doesn't have access to Secret A, then User 1 can't retrieve Secret A by using Parameter Store.
- Parameters that reference Secrets Manager secrets can't use the Parameter Store versioning or history features.
- Parameter Store honors Secrets Manager version stages. If you reference a version stage, it uses letters, numbers, a period (.), a hyphen (-), or an underscore (_). All other symbols specified in the version stage cause the reference to fail.

How to reference a Secrets Manager secret by using Parameter Store

The following procedure describes how to reference a Secrets Manager secret by using Parameter Store APIs. The procedure references other procedures in the *AWS Secrets Manager User Guide*.

> **Note**
>
> Before you begin, verify that you have permission to reference Secrets Manager secrets in Parameter Store parameters. If you have administrator permissions in Secrets Manager and Systems Manager, then you can reference or retrieve secrets by using Parameter Store APIs. If you reference a Secrets Manager secret in a Parameter Store parameter, and you don't have permission to access that secret, then the reference fails. For more information, see

Authentication and access control for AWS Secrets Manager in the *AWS Secrets Manager User Guide*.

Important

Parameter Store functions as a pass-through service for references to Secrets Manager secrets. Parameter Store doesn't retain data or metadata about secrets. The reference is stateless.

To reference a Secrets Manager secret by using Parameter Store

1. Create a secret in Secrets Manager. For more information, see Create and manage secrets with AWS Secrets Manager.
2. Reference a secret by using the AWS CLI, AWS Tools for Windows PowerShell, or the SDK. When you reference a Secrets Manager secret, the name must begin with the following reserved path: `/aws/reference/secretsmanager/`. By specifying this path, Systems Manager knows to retrieve the secret from Secrets Manager instead of Parameter Store. Here are some example names that correctly reference the Secrets Manager secrets, `CFCreds1` and `DBPass`, using Parameter Store.

   - `/aws/reference/secretsmanager/CFCreds1`
   - `/aws/reference/secretsmanager/DBPass`

   Here is a Java code example that references an access key and a secret key that are stored in Secrets Manager. This code example sets up an Amazon DynamoDB client. The code retrieves configuration data and credentials from Parameter Store. The configuration data is stored as a string parameter in Parameter Store and the credentials are stored in Secrets Manager. Even though the configuration data and credentials are stored in separate services, both sets of data can be accessed from Parameter Store by using the `GetParameter` API.

```
/**
* Initialize Systems Manager client with default credentials
*/
AWSSimpleSystemsManagement ssm =
 AWSSimpleSystemsManagementClientBuilder.defaultClient();
```

```
...

/**
* Example method to launch DynamoDB client with credentials different from default
* @return DynamoDB client
*/
AmazonDynamoDB getDynamoDbClient() {
    //Getting AWS credentials from Secrets Manager using GetParameter
    BasicAWSCredentials differentAWSCreds = new BasicAWSCredentials(
            getParameter("/aws/reference/secretsmanager/access-key"),
            getParameter("/aws/reference/secretsmanager/secret-key"));

    //Initialize the DynamoDB client with different credentials
    final AmazonDynamoDB client = AmazonDynamoDBClient.builder()
            .withCredentials(new AWSStaticCredentialsProvider(differentAWSCreds))
            .withRegion(getParameter("region")) //Getting configuration from
 Parameter Store
            .build();
    return client;
}

/**
* Helper method to retrieve parameter value
* @param parameterName identifier of the parameter
* @return decrypted parameter value
*/
public GetParameterResult getParameter(String parameterName) {
    GetParameterRequest request = new GetParameterRequest();
    request.setName(parameterName);
    request.setWithDecryption(true);
    return ssm.newGetParameterCall().call(request).getParameter().getValue();
}
```

Here are some AWS CLI examples. Use the `aws secretsmanager list-secrets` command to find the names of your secrets.

AWS CLI Example 1: Reference by using the name of the secret

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret \
```

```
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"aaabbbccc-1111-222-333-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "LastModifiedDate": 2018-05-14T21:47:14.743Z,
        "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-
              E18LRP",
      }
}
```

AWS CLI Example 2: Reference that includes the version ID

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret:11111-aaa-bbb-ccc-123456789 \
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret:11111-aaa-bbb-ccc-123456789 ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"11111-aaa-bbb-ccc-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "Selector": ":11111-aaa-bbb-ccc-123456789"
      }
        "LastModifiedDate": 2018-05-14T21:47:14.743Z,
        "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-
               E18LRP",
}
```

AWS CLI Example 3: Reference that includes the version stage

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret:AWSCURRENT \
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret:AWSCURRENT ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"11111-aaa-bbb-ccc-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "Selector": ":AWSCURRENT"
      }
      "LastModifiedDate": 2018-05-14T21:47:14.743Z,
      "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-

AWS KMS encryption for AWS Systems Manager Parameter Store SecureString parameters

With AWS Systems Manager Parameter Store, you can create SecureString parameters, which are parameters that have a plaintext parameter name and an encrypted parameter value. Parameter Store uses AWS KMS to encrypt and decrypt the parameter values of `SecureString` parameters.

With Parameter Store, you can create, store, and manage data as parameters with values. You can create a parameter in Parameter Store and use it in multiple applications and services subject to policies and permissions that you design. When you need to change a parameter value, you change one instance, rather than managing error-prone changes to numerous sources. Parameter Store supports a hierarchical structure for parameter names, so you can qualify a parameter for specific uses.

To manage sensitive data, you can create `SecureString` parameters. Parameter Store uses AWS KMS keys to encrypt the parameter values of `SecureString` parameters when you create or change them. It also uses KMS keys to decrypt the parameter values when you access them. You can use the AWS managed key that Parameter Store creates for your account or specify your own customer managed key.

> **Important**
>
> Parameter Store supports only symmetric KMS keys. You cannot use an asymmetric KMS key to encrypt your parameters. For help determining whether a KMS key is symmetric or asymmetric, see Identify different key types in the *AWS Key Management Service Developer Guide*.

Parameter Store supports two tiers of `SecureString` parameters: *standard* and *advanced*. Standard parameters, which cannot exceed 4096 bytes, are encrypted and decrypted directly under the KMS key that you specify. To encrypt and decrypt advanced `SecureString` parameters, Parameter Store uses envelope encryption with the AWS Encryption SDK. You can convert a standard `SecureString` parameter to an advanced parameter, but you cannot convert an advanced parameter to a standard one. For more information about the difference between standard and advanced `SecureString` parameters, see Managing parameter tiers.

Protecting standard SecureString parameters

Parameter Store does not perform any cryptographic operations. Instead, it relies on AWS KMS to encrypt and decrypt `SecureString` parameter values. When you create or change a standard `SecureString` parameter value, Parameter Store calls the AWS KMS Encrypt operation. This operation uses a symmetric encryption KMS key directly to encrypt the parameter value instead of using the KMS key to generate a data key.

You can select the KMS key that Parameter Store uses to encrypt the parameter value. If you do not specify a KMS key, Parameter Store uses the AWS managed key that Systems Manager automatically creates in your account. This KMS key has the `aws/ssm` alias.

To view the default `aws/ssm` KMS key for your account, use the DescribeKey operation in the AWS KMS API. The following example uses the `describe-key` command in the AWS Command Line Interface (AWS CLI) with the `aws/ssm` alias name.

```
aws kms describe-key \
    --key-id alias/aws/ssm
```

To create a standard `SecureString` parameter, use the PutParameter operation in the Systems Manager API. Omit the `Tier` parameter or specify a value of `Standard`, which is the default. Include a `Type` parameter with a value of `SecureString`. To specify a KMS key, use the `KeyId` parameter. The default is the AWS managed key for your account, `aws/ssm`.

Parameter Store then calls the AWS KMS `Encrypt` operation with the KMS key and the plaintext parameter value. AWS KMS returns the encrypted parameter value, which Parameter Store stores with the parameter name.

The following example uses the Systems Manager put-parameter command and its `--type` parameter in the AWS CLI to create a `SecureString` parameter. Because the command omits the optional `--tier` and `--key-id` parameters, Parameter Store creates a standard `SecureString` parameter and encrypts it under the AWS managed key.

```
aws ssm put-parameter \
    --name MyParameter \
    --value "secret_value" \
    --type SecureString
```

The following similar example uses the `--key-id` parameter to specify a customer managed key. The example uses a KMS key ID to identify the KMS key, but you can use any valid KMS key

identifier. Because the command omits the `Tier` parameter (`--tier`), Parameter Store creates a standard `SecureString` parameter, not an advanced one.

```
aws ssm put-parameter \
    --name param1 \
    --value "secret" \
    --type SecureString \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

When you get a `SecureString` parameter from Parameter Store, its value is encrypted. To get a parameter, use the GetParameter operation in the Systems Manager API.

The following example uses the Systems Manager get-parameter command in the AWS CLI to get the `MyParameter` parameter from Parameter Store without decrypting its value.

```
aws ssm get-parameter --name MyParameter
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "AQECAHgnOkMROh5LaLXkA4j0+vYi6tmM17Lg"
    }
}
```

To decrypt the parameter value before returning it, set the `WithDecryption` parameter of `GetParameter` to `true`. When you use `WithDecryption`, Parameter Store calls the AWS KMS Decrypt operation on your behalf to decrypt the parameter value. As a result, the `GetParameter` request returns the parameter with a plaintext parameter value, as shown in the following example.

```
aws ssm get-parameter \
    --name MyParameter \
    --with-decryption
```

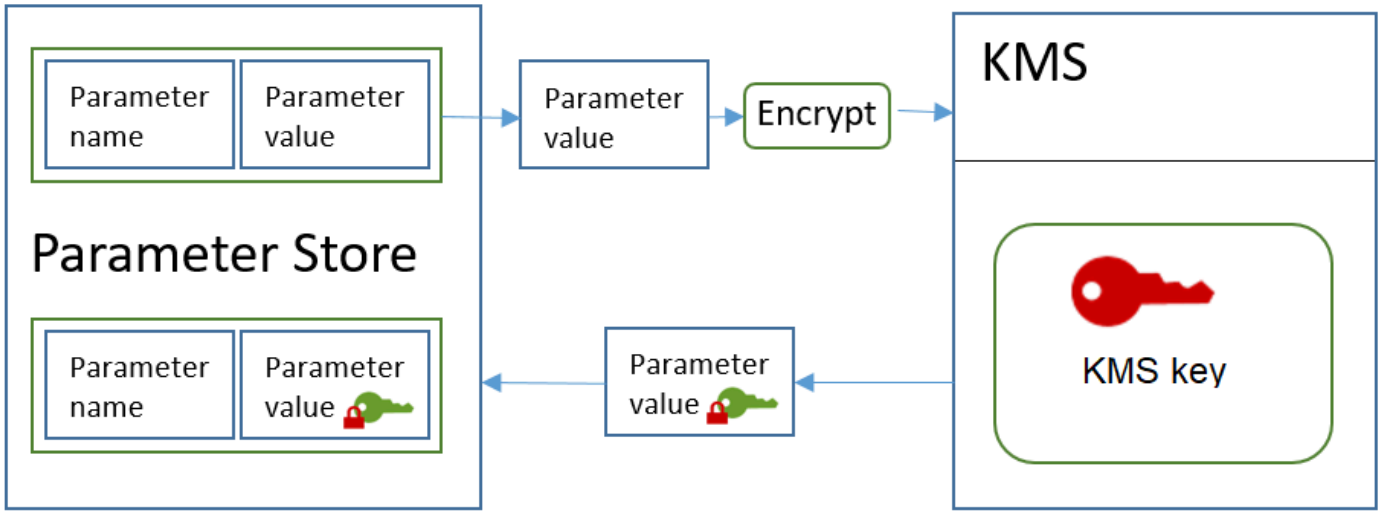
```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
```

```
        "Value": "secret_value"
    }
}
```

The following workflow shows how Parameter Store uses a KMS key to encrypt and decrypt a standard `SecureString` parameter.

Encrypt a standard parameter

1. When you use `PutParameter` to create a `SecureString` parameter, Parameter Store sends an `Encrypt` request to AWS KMS. That request includes the plaintext parameter value, the KMS key that you chose, and the Parameter Store encryption context. During transmission to AWS KMS, the plaintext value in the `SecureString` parameter is protected by Transport Layer Security (TLS).
2. AWS KMS encrypts the parameter value with the specified KMS key and encryption context. It returns the ciphertext to Parameter Store, which stores the parameter name and its encrypted value.



Decrypt a standard parameter

1. When you include the `WithDecryption` parameter in a `GetParameter` request, Parameter Store sends a `Decrypt` request to AWS KMS with the encrypted `SecureString` parameter value and the Parameter Store encryption context.
2. AWS KMS uses the same KMS key and the supplied encryption context to decrypt the encrypted value. It returns the plaintext (decrypted) parameter value to Parameter Store. During transmission, the plaintext data is protected by TLS.

3. Parameter Store returns the plaintext parameter value to you in the `GetParameter` response.

Protecting advanced SecureString parameters

When you use `PutParameter` to create an advanced `SecureString` parameter, Parameter Store uses envelope encryption with the AWS Encryption SDK and a symmetric encryption AWS KMS key to protect the parameter value. Each advanced parameter value is encrypted under a unique data key, and the data key is encrypted under a KMS key. You can use the AWS managed key for the account (`aws/ssm`) or any customer managed key.

The AWS Encryption SDK is an open-source, client-side library that helps you to encrypt and decrypt data using industry standards and best practices. It's supported on multiple platforms and in multiple programming languages, including a command-line interface. You can view the source code and contribute to its development in GitHub.

For each `SecureString` parameter value, Parameter Store calls the AWS Encryption SDK to encrypt the parameter value using a unique data key that AWS KMS generates (GenerateDataKey). The AWS Encryption SDK returns to Parameter Store an encrypted message that includes the encrypted parameter value and an encrypted copy of the unique data key. Parameter Store stores the entire encrypted message in the `SecureString` parameter value. Then, when you get an advanced `SecureString` parameter value, Parameter Store uses the AWS Encryption SDK to decrypt the parameter value. This requires a call to AWS KMS to decrypt the encrypted data key.

To create an advanced `SecureString` parameter, use the PutParameter operation in the Systems Manager API. Set the value of `Tier` parameter to `Advanced`. Include a `Type` parameter with a value of `SecureString`. To specify a KMS key, use the `KeyId` parameter. The default is the AWS managed key for your account, `aws/ssm`.

```
aws ssm put-parameter \
    --name MyParameter \
    --value "secret_value" \
    --type SecureString \
    --tier Advanced
```

The following similar example uses the `--key-id` parameter to specify a customer managed key. The example uses the Amazon Resource Name (ARN) of the KMS key, but you can use any valid KMS key identifier.

```
aws ssm put-parameter \
```

```
    --name MyParameter \
    --value "secret_value" \
    --type SecureString \
    --tier Advanced \
    --key-id arn:aws:kms:us-
east-2:987654321098:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

When you get a `SecureString` parameter from Parameter Store, its value is the encrypted message that the AWS Encryption SDK returned. To get a parameter, use the GetParameter operation in the Systems Manager API.

The following example uses the Systems Manager `GetParameter` operation to get the `MyParameter` parameter from Parameter Store without decrypting its value.

```
aws ssm get-parameter --name MyParameter
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "AQECAHgnOkMROh5LaLXkA4j0+vYi6tmM17Lg"
    }
}
```

To decrypt the parameter value before returning it, set the `WithDecryption` parameter of `GetParameter` to `true`. When you use `WithDecryption`, Parameter Store calls the AWS KMS Decrypt operation on your behalf to decrypt the parameter value. As a result, the `GetParameter` request returns the parameter with a plaintext parameter value, as shown in the following example.

```
aws ssm get-parameter \
    --name MyParameter \
    --with-decryption
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "secret_value"
    }
```

```
}
```

You cannot convert an advanced `SecureString` parameter to a standard one, but you can convert a standard `SecureString` to an advanced one. To convert a standard `SecureString` parameter to an advanced `SecureString`, use the `PutParameter` operation with the `Overwrite` parameter. The `Type` must be `SecureString` and the `Tier` value must be `Advanced`. The `KeyId` parameter, which identifies a customer managed key, is optional. If you omit it, Parameter Store uses the AWS managed key for the account. You can specify any KMS key that the principal has permission to use, even if you used a different KMS key to encrypt the standard parameter.

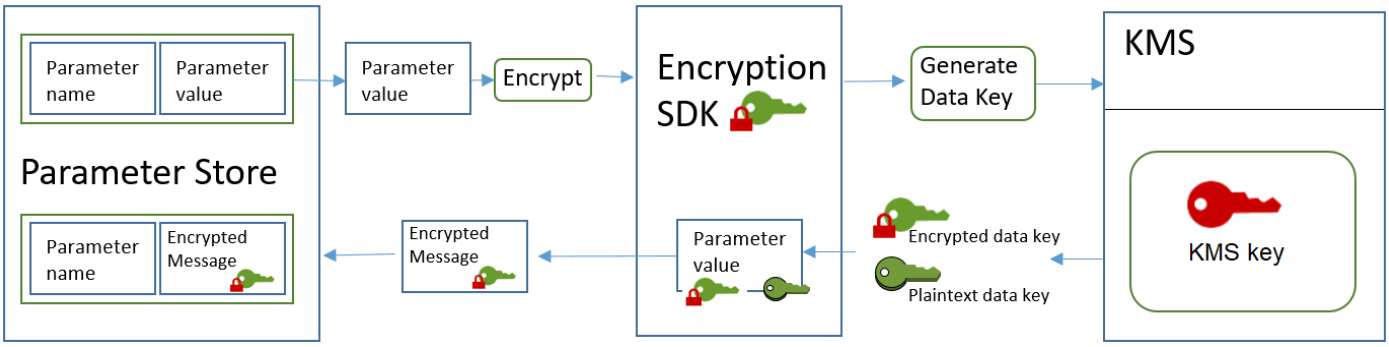
When you use the `Overwrite` parameter, Parameter Store uses the AWS Encryption SDK to encrypt the parameter value. Then it stores the newly encrypted message in Parameter Store.

```
aws ssm put-parameter \
    --name myStdParameter \
    --value "secret_value"  \
    --type SecureString \
    --tier Advanced \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --overwrite
```

The following workflow shows how Parameter Store uses a KMS key to encrypt and decrypt an advanced `SecureString` parameter.

Encrypt an advanced parameter

1. When you use `PutParameter` to create an advanced `SecureString` parameter, Parameter Store uses the AWS Encryption SDK and AWS KMS to encrypt the parameter value. Parameter Store calls the AWS Encryption SDK with the parameter value, the KMS key that you specified, and the Parameter Store encryption context.
2. The AWS Encryption SDK sends a GenerateDataKey request to AWS KMS with the identifier of the KMS key that you specified and the Parameter Store encryption context. AWS KMS returns two copies of the unique data key: one in plaintext and one encrypted under the KMS key. (The encryption context is used when encrypting the data key.)
3. The AWS Encryption SDK uses the plaintext data key to encrypt the parameter value. It returns an encrypted message that includes the encrypted parameter value, the encrypted data key, and other data, including the Parameter Store encryption context.
4. Parameter Store stores the encrypted message as the parameter value.



Decrypt an advanced parameter

1. You can include the `WithDecryption` parameter in a `GetParameter` request to get an advanced `SecureString` parameter. When you do, Parameter Store passes the encrypted message from the parameter value to a decryption method of the AWS Encryption SDK.
2. The AWS Encryption SDK calls the AWS KMS Decrypt operation. It passes in the encrypted data key and the Parameter Store encryption context from the encrypted message.
3. AWS KMS uses the KMS key and the Parameter Store encryption context to decrypt the encrypted data key. Then it returns the plaintext (decrypted) data key to the AWS Encryption SDK.
4. The AWS Encryption SDK uses the plaintext data key to decrypt the parameter value. It returns the plaintext parameter value to Parameter Store.
5. Parameter Store verifies the encryption context and returns the plaintext parameter value to you in the `GetParameter` response.

Setting permissions to encrypt and decrypt parameter values

To encrypt a standard `SecureString` parameter value, the user needs `kms:Encrypt` permission. To encrypt an advanced `SecureString` parameter value, the user needs `kms:GenerateDataKey` permission. To decrypt either type of `SecureString` parameter value, the user needs `kms:Decrypt` permission.

You can use AWS Identity and Access Management (IAM) policies to allow or deny permission for a user to call the Systems Manager `PutParameter` and `GetParameter` operations.

If you are using customer managed keys to encrypt your `SecureString` parameter values, you can use IAM policies and key policies to manage encrypt and decrypt permissions. However, you cannot

establish access control policies for the default `aws/ssm` KMS key. For detailed information about controlling access to customer managed keys, see KMS key access and permissions in the *AWS Key Management Service Developer Guide*.

The following example shows an IAM policy designed for standard `SecureString` parameters. It allows the user to call the Systems Manager `PutParameter` operation on all parameters in the `FinancialParameters` path. The policy also allows the user to call the AWS KMS `Encrypt` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": "arn:aws:ssm:us-east-1:111122223333:parameter/
FinancialParameters/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Encrypt"
            ],
            "Resource": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
        }
    ]
}
```

The next example shows an IAM policy that is designed for advanced `SecureString` parameters. It allows the user to call the Systems Manager `PutParameter` operation on all parameters in the `ReservedParameters` path. The policy also allows the user to call the AWS KMS `GenerateDataKey` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": "arn:aws:ssm:us-east-1:111122223333:parameter/
ReservedParameters/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:GenerateDataKey"
            ],
            "Resource": "arn:aws:kms:us-east-1:111122223333:key/key-id"
        }
    ]
}
```

The final example also shows an IAM policy that can be used for standard or advanced `SecureString` parameters. It allows the user to call the Systems Manager `GetParameter` operations (and related operations) on all parameters in the `ITParameters` path. The policy also allows the user to call the AWS KMS `Decrypt` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:GetParameter*"
            ],
            "Resource": "arn:aws:ssm:us-east-1:111122223333:parameter/
ITParameters/*"
```

```
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt"
            ],
            "Resource": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
        }
    ]
}
```

Parameter Store encryption context

An *encryption context* is a set of key–value pairs that contain arbitrary nonsecret data. When you include an encryption context in a request to encrypt data, AWS KMS cryptographically binds the encryption context to the encrypted data. To decrypt the data, you must pass in the same encryption context.

You can also use the encryption context to identify a cryptographic operation in audit records and logs. The encryption context appears in plaintext in logs, such as AWS CloudTrail logs.

The AWS Encryption SDK also takes an encryption context, although it handles it differently. Parameter Store supplies the encryption context to the encryption method. The AWS Encryption SDK cryptographically binds the encryption context to the encrypted data. It also includes the encryption context in plain text in the header of the encrypted message that it returns. However, unlike AWS KMS, the AWS Encryption SDK decryption methods do not take an encryption context as input. Instead, when it decrypts data, the AWS Encryption SDK gets the encryption context from the encrypted message. Parameter Store verifies that the encryption context includes the value that it expects before returning the plaintext parameter value to you.

Parameter Store uses the following encryption context in its cryptographic operations:

- Key: PARAMETER_ARN
- Value: The Amazon Resource Name (ARN) of the parameter that is being encrypted.

The format of the encryption context is as follows:

```
"PARAMETER_ARN":"arn:aws:ssm:region-id:account-id:parameter/parameter-name"
```

For example, Parameter Store includes this encryption context in calls to encrypt and decrypt the `MyParameter` parameter in an example AWS account and region.

```
"PARAMETER_ARN":"arn:aws:ssm:us-east-2:111122223333:parameter/MyParameter"
```

If the parameter is in a Parameter Store hierarchical path, the path and name are included in the encryption context. For example, this encryption context is used when encrypting and decrypting the `MyParameter` parameter in the `/ReadableParameters` path in an example AWS account and region.

```
"PARAMETER_ARN":"arn:aws:ssm:us-east-2:111122223333:parameter/ReadableParameters/
MyParameter"
```

You can decrypt an encrypted `SecureString` parameter value by calling the AWS KMS `Decrypt` operation with the correct encryption context and the encrypted parameter value that the Systems Manager `GetParameter` operation returns. However, we encourage you to decrypt Parameter Store parameter values by using the `GetParameter` operation with the `WithDecryption` parameter.

You can also include the encryption context in an IAM policy. For example, you can permit a user to decrypt only one particular parameter value or set of parameter values.

The following example IAM policy statement allows the user to the get value of the `MyParameter` parameter and to decrypt its value using the specified KMS key. However the permissions apply only when the encryption context matches specified string. These permissions do not apply to any other parameter or KMS key, and the call to `GetParameter` fails if the encryption context does not match the string.

Before using a policy statement like this one, replace the *`example ARNs`* with valid values.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:GetParameter*"
```

```
            ],
            "Resource": "arn:aws:ssm:us-
east-1:111122223333:parameter/MyParameter"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt"
            ],
            "Resource": "arn:aws:kms:us-east-1:111122223333:key/key-id",
            "Condition": {
                "StringEquals": {
                    "kms:EncryptionContext:PARAMETER_ARN":"arn:aws:ssm:us-
east-1:111122223333:parameter/MyParameter"
                }
            }
        }
    ]
}
```

Troubleshooting KMS key issues in Parameter Store

To perform any operation on a `SecureString` parameter, Parameter Store must be able to use the AWS KMS KMS key that you specify for your intended operation. Most of the Parameter Store failures related to KMS keys are caused by the following problems:

- The credentials that an application is using do not have permission to perform the specified action on the KMS key.

  To fix this error, run the application with different credentials or revise the IAM or key policy that is preventing the operation. For help with AWS KMS IAM and key policies, see KMS key access and permissions in the *AWS Key Management Service Developer Guide*.
- The KMS key is not found.

  This typically happens when you use an incorrect identifier for the KMS key. Find the correct identifiers for the KMS key and try the command again.
- The KMS key is not enabled. When this occurs, Parameter Store returns an InvalidKeyId exception with a detailed error message from AWS KMS. If the KMS key state is `Disabled`, enable it. If it is `Pending Import`, complete the import procedure. If the key state is `Pending Deletion`, cancel the key deletion or use a different KMS key.

To find the key state of a KMS key, use the DescribeKey operation.

Use Parameter Store parameters in Amazon Elastic Kubernetes Service

To show parameters from Parameter Store, a tool of AWS Systems Manager, as files mounted in Amazon EKS Pods, you can use the AWS Secrets and Configuration Provider for the Kubernetes Secrets Store CSI Driver. The ASCP works with Amazon Elastic Kubernetes Service 1.17+ running an Amazon EC2 node group. AWS Fargate node groups are not supported.

With the ASCP, you can store and manage your parameter in Parameter Store and then retrieve them through your workloads running on Amazon EKS. If your parameter contains multiple key-value pairs in JSON format, you can choose which ones to mount in Amazon EKS. The ASCP uses JMESPath syntax to query the key-value pairs in your secret. The ASCP also works with AWS Secrets Manager secrets.

The ASCP offers two methods of authentication with Amazon EKS The first approach uses IAM Roles for Service Accounts (IRSA). The second approach uses Pod Identities. Each approach has its benefits and use cases.

ASCP with IAM Roles for Service Accounts (IRSA)

The ASCP with IAM Roles for Service Accounts (IRSA) allows you to mount parameters from Parameter Store as files in your Amazon EKS Pods. This approach is suitable when:

- You need to mount parameters as files in your Pods.
- You're using Amazon EKS version 1.17 or later with Amazon EC2 node groups.
- You want to retrieve specific key-value pairs from JSON-formatted parameters.

For more information, see the section called “Integrate ASCP with IRSA for Amazon EKS”.

ASCP with Pod Identity

ASCP with EKS Pod Identity

The ASCP with Pod Identity method enhances security and simplifies configuration for accessing parameters in Parameter Store. This approach is beneficial when:

- You need more granular permission management at the Pod level.

- You're using Amazon EKS version 1.24 or later.
- You want improved performance and scalability.

For more information, see the section called “Integrate ASCP with Pod Identity for Amazon EKS”.

Choosing the right approach

Consider the following factors when deciding between ASCP with IRSA and ASCP with Pod Identity:

- Amazon EKSversion: Pod Identity requires Amazon EKS 1.24+, while CSI driver works with Amazon EKS 1.17+.
- Security requirements: Pod Identity offers more granular control at the Pod level.
- Performance: Pod Identity generally performs better in high-scale environments.
- Complexity: Pod Identity simplifies setup by eliminating the need for separate service accounts.

Choose the method that best aligns with your specific requirements and Amazon EKS environment.

Install ASCP for Amazon EKS

This section explains how to install the AWS Secrets and Configuration Provider for Amazon EKS. With ASCP, you can mount parameters from Parameter Store and secrets from AWS Secrets Manager as files in Amazon EKS Pods.

Prerequisites

- An Amazon EKS cluster
  - Version 1.24 or later for Pod Identity
  - Version 1.17 or later for IRSA
- The AWS CLI installed and configured
- kubectl installed and configured for your Amazon EKS cluster
- Helm (version 3.0 or later)

Install and configure the ASCP

The ASCP is available on GitHub in the secrets-store-csi-provider-aws repository. The repo also contains example YAML files for creating and mounting a secret by changing the `objectType` value from `secretsmanager` to `ssmparameter`.

During installation, you can configure the ASCP to use a FIPS endpoint. For a list of Systems Manager endpoints, see Systems Manager service endpoints in the *Amazon Web Services General Reference*.

To install the ASCP by using Helm

1. To make sure the repo is pointing to the latest charts, use `helm repo update`.
2. Add the Secrets Store CSI Driver chart.

```
helm repo add secrets-store-csi-driver https://kubernetes-sigs.github.io/secrets-store-csi-driver/charts
```

3. Install the chart. To configure throttling, add the following flag: `--set-json 'k8sThrottlingParams={"qps": "number of queries per second", "burst": "number of queries per second"}'`

```
helm install -n kube-system csi-secrets-store secrets-store-csi-driver/secrets-store-csi-driver
```

4. Add the ASCP chart.

```
helm repo add aws-secrets-manager https://aws.github.io/secrets-store-csi-driver-provider-aws
```

5. Install the chart. To use a FIPS endpoint, add the following flag: `--set useFipsEndpoint=true`

```
helm install -n kube-system secrets-provider-aws aws-secrets-manager/secrets-store-csi-driver-provider-aws
```

To install by using the YAML in the repo

- Use the following commands.

```
helm repo add secrets-store-csi-driver https://kubernetes-sigs.github.io/secrets-store-csi-driver/charts
helm install -n kube-system csi-secrets-store secrets-store-csi-driver/secrets-store-csi-driver
```

```
kubectl apply -f https://raw.githubusercontent.com/aws/secrets-store-csi-driver-
provider-aws/main/deployment/aws-provider-installer.yaml
```

Verify the installations

To verify the installations of your EKS cluster, Secrets Store CSI driver, and ASCP plugin, follow these steps:

1. Verify the EKS cluster:

   ```
   eksctl get cluster --name clusterName
   ```

   This command should return information about your cluster.

2. Verify the Secrets Store CSI driver installation:

   ```
   kubectl get pods -n kube-system -l app=secrets-store-csi-driver
   ```

   You should see Pods running with names like `csi-secrets-store-secrets-store-csi-driver-xxx`.

3. Verify the ASCP plugin installation:

   YAML installation

   ```
   $ kubectl get pods -n kube-system -l app=csi-secrets-store-provider-aws
   ```

   Example output:

   ```
   NAME                                     READY   STATUS    RESTARTS   AGE
   csi-secrets-store-provider-aws-12345      1/1     Running   0          2m
   ```

   Helm installation

   ```
   $  kubectl get pods -n kube-system -l app=secrets-store-csi-driver-provider-aws
   ```

   Example output:

```
NAME                                                     READY   STATUS    RESTARTS
 AGE
secrets-provider-aws-secrets-store-csi-driver-provider-67890       1/1
 Running   0          2m
```

You should see Pods in the Running state.

After running these commands, if everything is set up correctly, you should see all components running without any errors. If you encounter any issues, you may need to troubleshoot by checking the logs of the specific Pods that are having problems.

Troubleshooting

1. To check the logs of the ASCP provider, run:

   ```
   kubectl logs -n kube-system -l app=csi-secrets-store-provider-aws
   ```

2. Check the status of all pods in the kube-system namespace.

   Replace the *default placeholder text* with your own pod ID:

   ```
   kubectl -n kube-system get pods
   ```

   ```
   kubectl -n kube-system logs pod/pod-id
   ```

   All Pods related to the CSI driver and ASCP should be in the 'Running' state.

3. Check the CSI driver version:

   ```
   kubectl get csidriver secrets-store.csi.k8s.io -o yaml
   ```

   This command should return information about the installed CSI driver.

Additional resources

For more information about using ASCP with Amazon EKS, see the following resources:

- Using Pod Identity with Amazon EKS

- AWS Secrets Store CSI Driver on GitHub

Use AWS Secrets and Configuration Provider CSI with Pod Identity for Amazon EKS

The AWS Secrets and Configuration Provider integration with the Pod Identity Agent for Amazon Elastic Kubernetes Service provides enhanced security, simplified configuration, and improved performance for applications running on Amazon EKS. Pod Identity simplifies AWS Identity and Access Management (IAM) authentication for Amazon EKS when retrieving parameters from AWS Systems Manager Parameter Store or secrets from Secrets Manager.

Amazon EKS Pod Identity streamlines the process of configuring IAM permissions for Kubernetes applications by allowing permissions to be set up directly through Amazon EKS interfaces, reducing the number of steps and eliminating the need to switch between Amazon EKS and IAM services. Pod Identity enables the use of a single IAM role across multiple clusters without updating trust policies and supports role session tags for more granular access control. This approach not only simplifies policy management by allowing reuse of permission policies across roles but also enhances security by enabling access to AWS resources based on matching tags.

How it works

1. Pod Identity assigns an IAM role to the Pod.
2. ASCP uses this role to authenticate with AWS services.
3. If authorized, ASCP retrieves the requested parameters and makes them available to the Pod.

For more information, see Understand how Amazon EKS Pod Identity works in the *Amazon EKS User Guide*.

Prerequisites

> **Important**
>
> Pod Identity is supported only for Amazon EKS in the cloud. It is not supported for Amazon EKS Anywhere, Red Hat OpenShift Service on AWS, or self-managed Kubernetes clusters on Amazon EC2 instances.

- Amazon EKS cluster (version 1.24 or later)

- Access to AWS CLI and Amazon EKS cluster via `kubectl`
- (Optional) Access to two AWS accounts for cross-account access

Install the Amazon EKS Pod Identity Agent

To use Pod Identity with your cluster, you must install the Amazon EKS Pod Identity Agent add-on.

To install the Pod Identity Agent

- Install the Pod Identity Agent add-on on your cluster.

  Replace the *default placeholder text* with your own values:

```
eksctl create addon \
  --name eks-pod-identity-agent \
  --cluster clusterName \
  --region region
```

Set up ASCP with Pod Identity

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create an IAM role that can be assumed by the Amazon EKS service principal for Pod Identity:

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
      {
        "Effect": "Allow",
        "Principal": {
          "Service": "pods.eks.amazonaws.com"
        },
        "Action": [
          "sts:AssumeRole",
          "sts:TagSession"
        ]
      }
```

```
    ]
  }
```

Attach the IAM policy to the role.

Replace the *default placeholder text* with your own values:

```
aws iam attach-role-policy \
  --role-name MY_ROLE \
  --policy-arn POLICY_ARN
```

3. Create a Pod Identity association. For an example, see Create a Pod Identity association in the *Amazon EKS User Guide*
4. Create the `SecretProviderClass` that specifies which parameters or secrets to mount in the Pod:

```
kubectl apply -f kubectl apply -f https://raw.githubusercontent.com/aws/
secrets-store-csi-driver-provider-aws/main/examples/ExampleSecretProviderClass-
PodIdentity.yaml
```

The key difference in `SecretProviderClass` between IRSA and Pod Identity is the optional parameter `usePodIdentity`. It is an optional field that determines the authentication approach. When not specified, it defaults to using IAM Roles for Service Accounts (IRSA).

- To use EKS Pod Identity, use any of these values: `"true", "True", "TRUE", "t", "T"`.
- To explicitly use IRSA, set to any of these values: `"false", "False", "FALSE", "f", or "F"`.

5. Deploy the Pod that mounts the parameters or secrets under `/mnt/secrets-store`:

```
kubectl apply -f kubectl apply -f https://raw.githubusercontent.com/aws/secrets-
store-csi-driver-provider-aws/main/examples/ExampleDeployment-PodIdentity.yaml
```

6. If you use a private Amazon EKS cluster, make sure that the VPC that the cluster is in has an AWS STS endpoint. For information about creating an endpoint, see Interface VPC endpoints in the *AWS Identity and Access Management User Guide*.

Verify the secret mount

To verify that the parameter or secret is mounted properly, run the following command.

Replace the *default placeholder text* with your own values:

```
kubectl exec -it $(kubectl get pods | awk '/pod-identity-deployment/{print $1}' | head
 -1) -- cat /mnt/secrets-store/MyParameter
```

To set up Amazon EKS Pod Identity to access to parameters in Parameter Store

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create a parameter in Parameter Store, if you do not already have one. For information, see Creating Parameter Store parameters in Systems Manager.

Troubleshoot

You can view most errors by describing the Pod deployment.

To see error messages for your container

1. Get a list of Pod names with the following command. If you aren't using the default namespace, use `-n` *namespace*.

   ```
   kubectl get pods
   ```

2. To describe the Pod, in the following command, for *pod-id* use the Pod ID from the Pods you found in the previous step. If you aren't using the default namespace, use `-n` *NAMESPACE*.

   ```
   kubectl describe pod/pod-id
   ```

To see errors for the ASCP

- To find more information in the provider logs, in the following command, for *PODID* use the ID of the *csi-secrets-store-provider-aws* Pod.

  ```
  kubectl -n kube-system get pods
  kubectl -n kube-system logs pod/pod-id
  ```

Use AWS Secrets and Configuration Provider CSI with IAM Roles for Service Accounts (IRSA)

Topics

- Prerequisites
- Set up access control
- Identify which parameters to mount
- Troubleshoot

Prerequisites

- Amazon EKS cluster (version 1.17 or later)
- Access to AWS CLI and Amazon EKS cluster via `kubectl`

Set up access control

The ASCP retrieves the Amazon EKS Pod Identity and exchanges it for an IAM role. You set permissions in an IAM policy for that IAM role. When the ASCP assumes the IAM role, it gets access to the parameters you authorized. Other containers can't access the parameters unless you also associate them with the IAM role.

To grant your Amazon EKS Pod access to parameters in Parameter Store

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create an IAM OpenID Connect (OIDC) provider for the cluster if you don't already have one. For more information, see Create an IAM OIDC provider for your cluster in the *Amazon EKS User Guide*.
3. Create an IAM role for service account and attach the policy to it. For more information, see Create an IAM role for a service account in the *Amazon EKS User Guide*.
4. If you use a private Amazon EKS cluster, make sure that the VPC that the cluster is in has an AWS STS endpoint. For information about creating an endpoint, see Interface VPC endpoints in the *AWS Identity and Access Management User Guide*.

Identify which parameters to mount

To determine which parameters the ASCP mounts in Amazon EKS as files on the filesystem, you create a the section called "SecretProviderClass" YAML file. The `SecretProviderClass` lists the parameters to mount and the file name to mount them as. The `SecretProviderClass` must be in the same namespace as the Amazon EKS Pod it references.

Mount the parameters as files

The following instructions show how to mount parameters as files using example YAML files ExampleSecretProviderClass.yaml and ExampleDeployment.yaml.

To mount parameters in Amazon EKS

1. Apply the `SecretProviderClass` to the Pod:

```
kubectl apply -f ExampleSecretProviderClass.yaml
```

2. Deploy your Pod:

```
kubectl apply -f ExampleDeployment.yaml
```

3. The ASCP mounts the files.

Troubleshoot

You can view most errors by describing the Pod deployment.

To see error messages for your container

1. Get a list of Pod names with the following command. If you aren't using the default namespace, use `-n` *`name-space`*.

```
kubectl get pods
```

2. To describe the Pod, in the following command, for *`pod-id`* use the Pod ID from the Pods you found in the previous step. If you aren't using the default namespace, use `-n` *`nameSpace`*.

```
kubectl describe pod/pod-id
```

To see errors for the ASCP

- To find more information in the provider logs, in the following command, for *pod-id* use the ID of the *csi-secrets-store-provider-aws* Pod.

```
kubectl -n kube-system get pods
kubectl -n kube-system logs Pod/pod-id
```

- **Verify that the `SecretProviderClass` CRD is installed:**

```
kubectl get crd secretproviderclasses.secrets-store.csi.x-k8s.io
```

  This command should return information about the `SecretProviderClass` custom resource definition.

- **Verify that the SecretProviderClass object was created.**

```
kubectl get secretproviderclass SecretProviderClassName -o yaml
```

AWS Secrets and Configuration Provider code examples

ASCP authentication and access control examples

Example: IAM policy allowing Amazon EKS Pod Identity service (pods.eks.amazonaws.com) to assume the role and tag the session:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "pods.eks.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
```

```
        "sts:TagSession"
      ]
    }
  ]
}
```

SecretProviderClass

You use YAML to describe which parameters to mount in Amazon EKS using the ASCP. For examples, see the section called “SecretProviderClass usage”.

SecretProviderClass YAML structure

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
   name: name
spec:
  provider: aws
  parameters:
    region:
    failoverRegion:
    pathTranslation:
    usePodIdentity:
    preferredAddressType:
    objects:
```

The parameters field contains the details of the mount request:

region

(Optional) The AWS Region of the parameter. If you don't use this field, the ASCP looks up the Region from the annotation on the node. This lookup adds overhead to mount requests, so we recommend that you provide the Region for clusters that use large numbers of Pods.

If you also specify `failoverRegion`, the ASCP tries to retrieve the parameter from both Regions. If either Region returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from `region`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from `region`, but it is retrieved successfully from `failoverRegion`, then the ASCP mounts that parameter value.

`failoverRegion`

(Optional) If you include this field, the ASCP tries to retrieve the parameter from the Regions defined in `region` and this field. If either Region returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from `region`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from `region`, but it is retrieved successfully from `failoverRegion`, then the ASCP mounts that parameter value. For an example of how to use this field, see Multi-Region parameter failover.

pathTranslation

(Optional) A single substitution character to use if the file name in Amazon EKS will contain the path separator character, such as slash (/) on Linux. The ASCP can't create a mounted file that contains a path separator character. Instead, the ASCP replaces the path separator character with a different character. If you don't use this field, the replacement character is underscore (_), so for example, `My/Path/Parameter` mounts as `My_Path_Parameter`.

To prevent character substitution, enter the string `False`.

`usePodIdentity`

(Optional) Determines the authentication approach. When not specified, it defaults to IAM Roles for Service Accounts (IRSA) (IRSA).

- To use EKS Pod Identity, use any of these values: `"true""`, `"True"`, `"TRUE"`, `"t"`, or `"T"`.
- To explicitly use IRSA, set to any of these values: `"false"`, `"False"`, `"FALSE"`, `"f"`, or `"F""=`.

`preferredAddressType`

(Optional) Specifies the preferred IP address type for Pod Identity Agent endpoint communication. The field is only applicable when using EKS Pod Identity feature and will be ignored when using IAM Roles for Service Accounts.Values are case-insensitive. Valid values are:

- `"ipv4"`, `"IPv4""`, or `"IPV4"` – Force the use of Pod Identity Agent IPv4 endpoint
- `"ipv6"`, `"IPv6"`, or `"IPV6"` – Force the use of Pod Identity Agent IPv6 endpoint
- not specified – Use auto endpoint selection, trying IPv4 endpoint first and falling back to IPv6 endpoint if IPv4 fails

objects

A string containing a YAML declaration of the secrets to be mounted. We recommend using a YAML multi-line string or pipe (|) character.

objectName

Required. Specifies the name of the parameter or secret to be fetched. For Parameter Store, this is the `Name` of the parameter and can be either the name or full ARN of the parameter. For Secrets Manager this is the `SecretId` parameter and can be either the friendly name or full ARN of the secret.

objectType

Required if you don't use a Secrets Manager ARN for `objectName`. For Parameter Store, use `ssmparameter`. For Secrets Manager, use `secretsmanager`.

objectAlias

(Optional) The file name of the secret in the Amazon EKS Pod. If you don't specify this field, the `objectName` appears as the file name.

objectVersion

(Optional) The version ID of the parameter. Not recommended because you must update the version ID every time you update the parameter. By default the most recent version is used. If you include a `failoverRegion`, this field represents the primary `objectVersion`.

objectVersionLabel

(Optional) The alias for the version. The default is the most recent version `AWSCURRENT`. If you include a `failoverRegion`, this field represents the primary `objectVersionLabel`.

jmesPath

(Optional) A map of the keys in the parameter to the files to be mounted in Amazon EKS. To use this field, your parameter value must be in JSON format.

The following example shows what a JSON encoded parameter looks like.

```
{
    "username" : "myusername",
    "password" : "mypassword"
}
```

The keys are `username` and `password`. The value associated with `username` is `myusername`, and the value associated with `password` is `mypassword`.

If you use this field, you must include the subfields `path` and `objectAlias`.

path

A key from a key-value pair in the JSON of the parameter value. If the field contains a hyphen, use single quotes to escape it, for example: `path: '"hyphenated-path"'`

objectAlias

The file name to be mounted in the Amazon EKS Pod. If the field contains a hyphen, use single quotes to escape it, for example: `objectAlias: '"hyphenated-alias"'`

`failoverObject`

(Optional) If you specify this field, the ASCP tries to retrieve both the parameter specified in the primary `objectName` and the parameter specified in the `failoverObject` `objectName` sub-field. If either returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from the primary `objectName`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from the primary `objectName`, but it is retrieved successfully from the failover `objectName`, then the ASCP mounts that parameter value. If you include this field, you must include the field `objectAlias`. For an example of how to use this field, see Failover to a different parameter.

You typically use this field when the failover parameter isn't a replica. For an example of how to specify a replica, see Multi-Region parameter failover.

objectName

The name or full ARN of the failover parameter. If you use an ARN, the Region in the ARN must match the field `failoverRegion`.

objectVersion

(Optional) The version ID of the parameter. Must match the primary `objectVersion`. Not recommended because you must update the version ID every time you update the parameter. By default the most recent version is used.

objectVersionLabel

(Optional) The alias for the version. The default is the most recent version `AWSCURRENT`.

Create a basic SecretProviderClass configuration to mount parameters in your Amazon EKS Pods.

Pod Identity

SecretProviderClass to use a parameter in the same Amazon EKS cluster:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameter-store
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "MyParameter"
        objectType: "ssmparameter"
    usePodIdentity: "true"
```

IRSA

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: deployment-aws-parameter
spec:
  provider: aws
  parameters:
    objects: |
        - objectName: "MyParameter"
          objectType: "ssmparameter"
```

SecretProviderClass usage

Use these examples to create `SecretProviderClass` configurations for different scenarios.

Example: Mount parameters by name or ARN

This example shows how to mount three different types of parameters:

- A parameter specified by full ARN

- A parameter specified by name
- A parameter version of a secret

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "arn:aws:ssm:us-east-2:777788889999:parameter:MyParameter2-d4e5f6"
      - objectName: "MyParameter3"
        objectType: "ssmparameter"
      - objectName: "MyParameter4"
        objectType: "ssmparameter"
        objectVersionLabel: "AWSCURRENT"
```

Example: Mount key-value pairs from a parameter

This example shows how to mount specific key-value pairs from a JSON-formatted parameter:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "arn:aws:ssm:us-east-2:777788889999:parameter:MyParameter-a1b2c3"
        jmesPath:
            - path: username
              objectAlias: dbusername
            - path: password
              objectAlias: dbpassword
```

Example: Failover configuration examples

These examples show how to configure failover for parameters.

Multi-Region parameter failover

This example shows how to configure automatic failover for a parameter replicated across multiple Regions:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    region: us-east-1
    failoverRegion: us-east-2
    objects: |
      - objectName: "MyParameter"
```

Failover to a different parameter

This example shows how to configure failover to a different parameter (not a replica):

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    region: us-east-1
    failoverRegion: us-east-2
    objects: |
      - objectName: "arn:aws:ssm:us-east-1:777788889999:parameter:MyParameter-a1b2c3"
        objectAlias: "MyMountedParameter"
        failoverObject:
          - objectName: "arn:aws:ssm:us-
east-2:777788889999:parameter:MyFailoverParameter-d4e5f6"
```

Additional resources

For more information about using ASCP with Amazon EKS, see the following resources:

- Using Pod Identity with Amazon EKS

- AWS Secrets Store CSI Driver on GitHub

Using Parameter Store parameters in AWS Lambda functions

Parameter Store, a tool in AWS Systems Manager, provides secure, hierarchical storage for configuration data management and secrets management. You can store data such as passwords, database strings, Amazon Machine Image (AMI) IDs, and license codes as parameter values.

To use parameters from Parameter Store in AWS Lambda functions without using an SDK, you can use the AWS Parameters and Secrets Lambda Extension. This extension retrieves parameter values and caches them for future use. Using the Lambda extension can reduce your costs by reducing the number of API calls to Parameter Store. Using the extension can also improve latency because retrieving a cached parameter is faster than retrieving it from Parameter Store.

A Lambda extension is a companion process that augments the capabilities of a Lambda function. An extension is like a client that runs in parallel to a Lambda invocation. This parallel client can interface with your function at any point during its lifecycle. For more information about Lambda extensions, see Lambda Extensions API in the *AWS Lambda Developer Guide*.

The AWS Parameters and Secrets Lambda Extension works for both Parameter Store and AWS Secrets Manager. To learn how to use the Lambda extension with secrets from Secrets Manager, see Use AWS Secrets Manager secrets in AWS Lambda functions in the *AWS Secrets Manager User Guide*.

Related info

Using the AWS Parameter and Secrets Lambda extension to cache parameters and secrets (AWS Compute Blog)

How the extension works

To use parameters in a Lambda function *without* the Lambda extension, you must configure your Lambda function to receive configuration updates by integrating with the `GetParameter` API action for Parameter Store.

When you use the AWS Parameters and Secrets Lambda Extension, the extension retrieves the parameter value from Parameter Store and stores it in the local cache. Then, the cached value is used for further invocations until it expires. Cached values expire after they pass their time-to-live (TTL). You can configure the TTL value using the `SSM_PARAMETER_STORE_TTL` environment variable, as explained later in this topic.

If the configured cache TTL has not expired, the cached parameter value is used. If the time has expired, the cached value is invalidated and the parameter value is retrieved from Parameter Store.

Also, the system detects parameter values that are used frequently and maintains them in the cache while clearing those that are expired or unused.

> **Important**
>
> The extension can be invoked only in the `INVOKE` phase of the Lambda operation and not during the `INIT` phase.

Implementation details

Use the following details to help you configure the AWS Parameters and Secrets Lambda Extension.

Authentication

To authorize and authenticate Parameter Store requests, the extension uses the same credentials as those used to run the Lambda function itself. Therefore, the AWS Identity and Access Management (IAM) role used to run the function must have the following permissions to interact with Parameter Store:

- `ssm:GetParameter` – Required to retrieve parameters from Parameter Store
- `kms:Decrypt` – Required if you are retrieving `SecureString` parameters from Parameter Store

For more information, see AWS Lambda execution role in the *AWS Lambda Developer Guide*.

Instantiation

Lambda instantiates separate instances corresponding to the concurrency level that your function requires. Each instance is isolated and maintains its own local cache of your configuration data. For more information about Lambda instances and concurrency, see Configuring reserved concurrency in the *AWS Lambda Developer Guide*.

No SDK dependence

The AWS Parameters and Secrets Lambda Extension works independently of any AWS SDK language library. An AWS SDK is not required to make GET requests to Parameter Store.

Localhost port

Use `localhost` in your GET requests. The extension makes requests to localhost port 2773. You do not need to specify an external or internal endpoint to use the extension. You can configure the port by setting the environment variable `PARAMETERS_SECRETS_EXTENSION_HTTP_PORT`.

For example, in Python, your GET URL might look something like the following example.

```
parameter_url = ('http://localhost:' + port + '/systemsmanager/parameters/get/?
name=' + ssm_parameter_path)
```

Changes to a parameter value before TTL expires

The extension doesn't detect changes to the parameter value and doesn't perform an auto-refresh before the TTL expires. If you change a parameter value, operations that use the cached parameter value might fail until the cache is next refreshed. If you expect frequent changes to a parameter value, we recommend setting a shorter TTL value.

Header requirement

To retrieve parameters from the extension cache, the header of your GET request must include an `X-Aws-Parameters-Secrets-Token` reference. Set the token to `AWS_SESSION_TOKEN`, which is provided by Lambda for all running functions. Using this header indicates that the caller is within the Lambda environment.

Example

The following example in Python demonstrates a basic request to retrieve the value of a cached parameter.

```
import urllib.request
import os
import json

aws_session_token = os.environ.get('AWS_SESSION_TOKEN')

def lambda_handler(event, context):
    # Retrieve /my/parameter from Parameter Store using extension cache
    req = urllib.request.Request('http://localhost:2773/systemsmanager/parameters/
get?name=%2Fmy%2Fparameter')
    req.add_header('X-Aws-Parameters-Secrets-Token', aws_session_token)
    config = urllib.request.urlopen(req).read()
```

```
    return json.loads(config)
```

ARM support

The extension supports the ARM architecture in most AWS Regions where the x86_64 and x86 architectures are supported. If you are using the ARM architecture, we suggest you verify your architecture is supported. For complete lists of extension ARNs, see AWS Parameters and Secrets Lambda Extension ARNs.

Logging

Lambda logs execution information about the extension along with the function by using Amazon CloudWatch Logs. By default, the extension logs a minimal amount of information to CloudWatch. To log more details, set the environment variable `PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL` to `DEBUG`.

Adding the extension to a Lambda function

To use the AWS Parameters and Secrets Lambda Extension, you add the extension to your Lambda function as a layer.

Use one of the following methods to add the extension to your function.

AWS Management Console (Add layer option)

1. Open the AWS Lambda console at https://eusc-de-east-1.console.amazonaws-eusc.eu/lambda/.
2. Choose your function. In the **Layers** area, choose **Add a layer**.
3. In the **Choose a layer** area, choose the **AWS layers** option.
4. For **AWS layers**, choose **AWS-Parameters-and-Secrets-Lambda-Extension**, choose a version, and then choose **Add**.

AWS Management Console (Specify ARN option)

1. Open the AWS Lambda console at https://eusc-de-east-1.console.amazonaws-eusc.eu/lambda/.
2. Choose your function. In the **Layers** area, choose **Add a layer**.
3. In the **Choose a layer** area, choose the **Specify an ARN** option.
4. For **Specify an ARN**, enter the extension ARN for your AWS Region and architecture, and then choose **Add**.

AWS Command Line Interface

Run the following command in the AWS CLI. Replace each *example resource placeholder* with your own information.

```
aws lambda update-function-configuration \
    --function-name function-name \
    --layers layer-ARN
```

Related information

Using layers with your Lambda function

Configuring extensions (.zip file archive)

AWS Parameters and Secrets Lambda Extension environment variables

You can configure the extension by changing the following environment variables. To see the current settings, set PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL to DEBUG. For more information, see Using AWS Lambda environment variables in the *AWS Lambda Developer Guide*.

> **Note**
>
> AWS Lambda records operation details about the Lambda extension and Lambda function in Amazon CloudWatch Logs.

Environment variable	Details	Required	Valid values	Default value
SSM_PARAMETER_STORE_TIMEOUT_MILLIS	Timeout, in milliseconds, for requests to Parameter Store. A value of 0 (zero) indicates no timeout.	No	All whole numbers	0 (zero)

Environment variable	Details	Required	Valid values	Default value
SECRETS_MANAGER_TIMEOUT_MILLIS	Timeout, in milliseconds, for requests to Secrets Manager. A value of 0 (zero) indicates no timeout.	No	All whole numbers	0 (zero)
SSM_PARAMETER_STORE_TTL	Maximum valid lifetime, in seconds, of a parameter in the cache before it is invalidated. A value of 0 (zero) indicates that the cache should be bypassed. This variable is ignored if the value for PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE is 0 (zero).	No	0 (zero) to 300 s (Five minutes)	300 s (Five minutes)

Environment variable	Details	Required	Valid values	Default value
SECRETS_MANAGER_TTL	Maximum valid lifetime, in seconds, of a secret in the cache before it is invalidated. A value of 0 (zero) indicates that the cache is bypassed. This variable is ignored if the value for PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE is 0 (zero).	No	0 (zero) to 300 s (Five minutes)	300 s (5 minutes)
PARAMETERS_SECRETS_EXTENSION_CACHE_ENABLED	Determines whether the cache for the extension is enabled. Value values: TRUE | FALSE	No	TRUE | FALSE	TRUE

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE	The maximum size of the cache in terms of number of items. A value of 0 (zero) indicates that the cache is bypassed. This variable is ignored if both cache TTL values are 0 (zero).	No	0 (zero) to 1000	1000
PARAMETERS_SECRETS_EXTENSION_HTTP_PORT	The port for the local HTTP server.	No	1 - 65535	2773

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_MAX_CONNECTIONS	Maximum number of connections for the HTTP clients that the extension uses to make requests to Parameter Store or Secrets Manager. This is a per-client configuration for the number of connections that both the Secrets Manager client and Parameter Store client make to the backend services.	No	Minimum of 1; No maximum limit.	3

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL	The level of detail reported in logs for the extension. We recommend using DEBUG for the most detail about your cache configuration as you set up and test the extension. Logs for Lambda operations are automatically pushed to an associated CloudWatch Logs log group.	No	DEBUG | WARN | ERROR | NONE | INFO	INFO

Sample commands for using the AWS Systems Manager Parameter Store and AWS Secrets Manager Extension

The examples in this section demonstrate API actions for use with the AWS Systems Manager Parameter Store and AWS Secrets Manager extension.

Sample commands for Parameter Store

The Lambda extension uses read-only access to the **GetParameter** API action.

To call this action, make an HTTP GET call similar to the following. This command format provides access to parameters in the standard parameter tier.

```
GET http://localhost:port/systemsmanager/parameters/get?name=parameter-
name&version=version&label=label&withDecryption={true|false}
```

In this example, *parameter-name* represents the full parameter name, such as `MyParameter`, for a parameter not in a hierarchy, or `%2FDev%2FProduction%2FEast%2FProject-ABC %2FMyParameter` for a parameter named `/Dev/Production/East/Project-ABC/ MyParameter` that is part of a hierarchy.

> **Note**
>
> When using GET calls, parameter values must be encoded for HTTP to preserve special characters. For example, instead of formatting a hierarchical path like `/a/b/c`, encode characters that could be interpreted as part of the URL, such as `%2Fa%2Fb%2Fc`.

version and *label* are the selectors available for use with the `GetParameter` action.

```
GET http://localhost:port/systemsmanager/parameters/get/?name=MyParameter&version=5
```

To call a parameter in a hierarchy, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=%2Fa%2Fb%2F&label=release
```

To call a public (global) parameter, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get/?name=%2Faws%2Fservice%20list
%2F...
```

To make an HTTP GET call to a Secrets Manager secret by using Parameter Store references, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=%2Faws%2Freference
%2Fsecretsmanager%2F...
```

To make a call using the Amazon Resource Name (ARN) for a parameter, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=arn:aws:ssm:us-
east-1:123456789012:parameter/MyParameter
```

To make a call that accesses a `SecureString` parameter with decryption, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?
name=MyParameter&withDecryption=true
```

You can specify that parameters aren't decrypted by omitting `withDecryption` or explicitly setting it to `false`. You can also specify either a version or a label, but not both. If you do, only the first of these that is placed after question mark (?) in the URL is used.

AWS Parameters and Secrets Lambda Extension ARNs

The following tables provide extension ARNs for supported architectures and Regions.

Topics

- Extension ARNs for the x86_64 and x86 architectures
- Extension ARNs for ARM64 and Mac with Apple silicon architectures

Extension ARNs for the x86_64 and x86 architectures

Last updated: October 22, 2025

Region	ARN

Integration with other products and services

AWS Systems Manager has built-in integration for the products and services shown in the following table.

Ansible	Ansible is an IT automation platform that makes your applications and systems easier to deploy.

	Systems Manager provides the Systems Manager document (SSM document) `AWS-ApplyAnsiblePlaybooks` which allows you to create State Manager associations that run Ansible playbooks. **Learn more** Creating associations that run Ansible playbooks
Chef	Chef is an IT automation tool that makes your applications and systems easier to deploy. Systems Manager provides the `AWS-ApplyChefRecipes` SSM document, which allows you to create associations in State Manager, a tool in AWS Systems Manager, that run Chef recipes. **Learn more** Creating associations that run Chef recipes Systems Manager also integrates with Chef InSpec profiles, allowing you to run compliance scans and view compliant and noncompliant nodes. **Learn more** Using Chef InSpec profiles with Systems Manager Compliance

GitHub	GitHub provides hosting for software development version control and collaboration. Systems Manager provides the SSM document `AWS-RunDocument`, which allows you to run other SSM documents stored in GitHub, and the SSM document `AWS-RunRemoteScript`, which allows you to run scripts stored in GitHub. **Learn more** • Running documents from remote locations • Running scripts from GitHub
Jenkins	Jenkins is an open-source automation server that allows developers to reliably build, test, and deploy their software. Automation, a tool in Systems Manager, can be used as a post-build step to pre-install application releases into Amazon Machine Images (AMIs). **Learn more** Updating AMIs using Automation and Jenkins

ServiceNow	ServiceNow is an enterprise service management system that allows you to manage your IT services and operations. Automation, Change Manager, Incident Manager, and OpsCenter, all tools in Systems Manager, integrate with ServiceNow by using the AWS Service Management Connector. With this integration, you can view, create, update, add correspondence, and resolve AWS Support cases from ServiceNow. **Learn more** Integrating with ServiceNow

Terraform	HashiCorp Terraform is an open-source *infrastructure as code* (IaC) software tool that provides a command line interface (CLI) workflow to manage various cloud services. For Systems Manager, you can use Terraform to manage or provision the following: **Resources** • aws_ssm_activation • aws_ssm_association • aws_ssm_default_patch_baseline • aws_ssm_document • aws_ssm_maintenance_window • aws_ssm_maintenance_window_target • aws_ssm_maintenance_window_task • aws_ssm_parameter • aws_ssm_patch_baseline • aws_ssm_patch_group • aws_ssm_resource_data_sync • aws_ssm_service_setting **Data sources** • aws_ssm_document • aws_ssm_instances • ssm_maintenance_windows • aws_ssm_parameter • aws_ssm_parameters_by_path • aws_ssm_patch_baseline

Topics

- Running scripts from GitHub

- Integrating with ServiceNow

Running scripts from GitHub

This topic describes how to use the pre-defined Systems Manager document (SSM document) `AWS-RunRemoteScript` to download scripts from GitHub, including Ansible Playbooks, Python, Ruby, and PowerShell scripts. By using this SSM document, you no longer need to manually port scripts into Amazon Elastic Compute Cloud (Amazon EC2) or wrap them in SSM documents. AWS Systems Manager integration with GitHub promotes *infrastructure as code*, which reduces the time it takes to manage nodes while standardizing configurations across your fleet.

You can also create custom SSM documents that allow you to download and run scripts or other SSM documents from remote locations. For more information, see Creating composite documents.

You can also download a directory that includes multiple scripts. When you run the primary script in the directory, Systems Manager also runs any referenced scripts that are included in the directory.

Note the following important details about running scripts from GitHub.

- Systems Manager doesn't verify that your script is capable of running on a node. Before you download and run the script, verify that the required software is installed on the node. Or, you can create a composite document that installs the software by using either Run Command or State Manager,tools in AWS Systems Manager, and then downloads and runs the script.
- You're responsible for ensuring that all GitHub requirements are met. This includes refreshing your access token, as needed. Ensure that you don't surpass the number of authenticated or unauthenticated requests. For more information, see the GitHub documentation.
- GitHub Enterprise repositories are not supported.

Topics

- Run Ansible Playbooks from GitHub
- Run Python scripts from GitHub

Run Ansible Playbooks from GitHub

This section includes procedures to help you run Ansible Playbooks from GitHub by using either the console or the AWS Command Line Interface (AWS CLI).

Before you begin

If you plan to run a script stored in a private GitHub repository, create an AWS Systems Manager `SecureString` parameter for your GitHub security access token. You can't access a script in a private GitHub repository by manually passing your token over SSH. The access token must be passed as a Systems Manager `SecureString` parameter. For more information about creating a `SecureString` parameter, see Creating Parameter Store parameters in Systems Manager.

Run an Ansible Playbook from GitHub (console)

Run an Ansible Playbook from GitHub

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **`AWS-RunRemoteScript`**.
5. In **Command parameters**, do the following:

   - In **Source Type**, select **GitHub**.
   - In the **Source Info** box, enter the required information to access the source in the following format.

   ```
   {
     "owner": "owner_name",
     "repository": "repository_name",
     "getOptions": "branch:branch_name",
     "path": "path_to_scripts_or_directory",
     "tokenInfo": "{{ssm-secure:SecureString_parameter_name}}"
   }
   ```

   This example downloads a file named `webserver.yml`.

   ```
   {
   ```

```
    "owner": "TestUser1",
    "repository": "GitHubPrivateTest",
    "getOptions": "branch:myBranch",
    "path": "scripts/webserver.yml",
    "tokenInfo": "{{ssm-secure:mySecureStringParameter}}"
}
```

> **Note**
>
> "branch" is required only if your SSM document is stored in a branch other than master.
> To use the version of your scripts that are in a particular *commit* in your repository, use commitID with getOptions instead of branch. For example:
> "getOptions": "commitID:bbc1ddb94...b76d3bEXAMPLE",

- In the **Command Line** field, enter parameters for the script execution. Here is an example.

  ansible-playbook -i “localhost,” --check -c local webserver.yml

- (Optional) In the **Working Directory** field, enter the name of a directory on the node where you want to download and run the script.
- (Optional) In **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.

6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

- For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

  > **Note**
  >
  > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run an Ansible Playbook from GitHub by using the AWS CLI

1. Install and configure the AWS Command Line Interface (AWS CLI), if you haven't already.

   For information, see Installing or updating the latest version of the AWS CLI.

2. Run the following command to download and run a script from GitHub.

```
aws ssm send-command \
    --document-name "AWS-RunRemoteScript" \
    --instance-ids "instance-IDs"\
    --parameters '{"sourceType":["GitHub"],"sourceInfo":["{\"owner
\":\"owner_name\", \"repository\": \"repository_name\", \"path
\": \"path_to_file_or_directory\", \"tokenInfo\":\"{{ssm-
secure:name_of_your_SecureString_parameter}}\" }"],"commandLine":
["commands_to_run"]}'
```

   Here is an example command to run on a local Linux machine.

```
aws ssm send-command \
    --document-name "AWS-RunRemoteScript" \
    --instance-ids "i-02573cafcfEXAMPLE" \
    --parameters '{"sourceType":["GitHub"],"sourceInfo":["{\"owner\":\"TestUser1\",
 \"repository\": \"GitHubPrivateTest\", \"path\": \"scripts/webserver.yml\",
 \"tokenInfo\":\"{{ssm-secure:mySecureStringParameter}}\" }"],"commandLine":
["ansible-playbook -i “localhost,” --check -c local webserver.yml"]}'
```

Run Python scripts from GitHub

This section includes procedures to help you run Python scripts from GitHub by using either the AWS Systems Manager console or the AWS Command Line Interface (AWS CLI).

Run a Python script from GitHub (console)

Run a Python script from GitHub

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.

4. In the **Command document** list, choose **AWS-RunRemoteScript**.
5. For **Command parameters**, do the following:

   - In **Source Type**, select **GitHub**.
   - In the **Source Info** box, enter the required information to access the source in the following format:

     ```
     {
         "owner": "owner_name",
         "repository": "repository_name",
         "getOptions": "branch:branch_name",
         "path": "path_to_document",
         "tokenInfo": "{{ssm-secure:SecureString_parameter_name}}"
     }
     ```

     The following example downloads a directory of scripts named *complex-script*.

     ```
     {
         "owner": "TestUser1",
         "repository": "SSMTestDocsRepo",
         "getOptions": "branch:myBranch",
         "path": "scripts/python/complex-script",
         "tokenInfo": "{{ssm-secure:myAccessTokenParam}}"
     }
     ```

     Note

     `"branch"` is required only if your scripts are stored in a branch other than `master`. To use the version of your scripts that are in a particular *commit* in your repository, use `commitID` with `getOptions` instead of `branch`. For example: `"getOptions": "commitID:bbc1ddb94...b76d3bEXAMPLE",`

   - For **Command Line**, enter parameters for the script execution. Here is an example.

     ```
     mainFile.py argument-1 argument-2
     ```

     This example runs `mainFile.py`, which can then run other scripts in the `complex-script` directory.

- (Optional) For **Working Directory**, enter the name of a directory on the node where you want to download and run the script.
- (Optional) For **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.

6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

- For **Comment**, enter information about this command.
- For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

- For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run a Python script from GitHub by using the AWS CLI

1. Install and configure the AWS Command Line Interface (AWS CLI), if you haven't already.

   For information, see Installing or updating the latest version of the AWS CLI.

2. Run the following command to download and run a script from GitHub.

```
aws ssm send-command --document-name "AWS-RunRemoteScript" --instance-
ids "instance-IDs" --parameters '{"sourceType":["GitHub"],"sourceInfo":
["{\"owner\":\"owner_name\", \"repository\":\"repository_name\", \"path\":
 \"path_to_script_or_directory\"}"],"commandLine":["commands_to_run"]}'
```

   Here is an example.

```
aws ssm send-command --document-name "AWS-RunRemoteScript" --instance-ids
 "i-02573cafcfEXAMPLE" --parameters '{"sourceType":["GitHub"],"sourceInfo":
["{\"owner\":\"TestUser1\", \"repository\":\"GitHubTestPublic\", \"path\":
 \"scripts/python/complex-script\"}"],"commandLine":["mainFile.py argument-1
 argument-2 "]}'
```

This example downloads a directory of scripts called `complex-script`. The `commandLine` entry runs `mainFile.py`, which can then run other scripts in the `complex-script` directory.

Using Chef InSpec profiles with Systems Manager Compliance

AWS Systems Manager integrates with Chef InSpec. Chef InSpec is an open-source testing framework that allows you to create human-readable profiles to store in GitHub or Amazon Simple Storage Service (Amazon S3). Then you can use Systems Manager to run compliance scans and view compliant and noncompliant nodes. A *profile* is a security, compliance, or policy requirement for your computing environment. For example, you can create profiles that perform the following checks when you scan your nodes with Compliance, a tool in AWS Systems Manager:

- Check if specific ports are open or closed.
- Check if specific applications are running.
- Check if certain packages are installed.
- Check Windows Registry keys for specific properties.

You can create InSpec profiles *only* for Amazon Elastic Compute Cloud (Amazon EC2) instances that you manage with Systems Manager. On-premises servers or virtual machines (VMs) are not supported. The following sample Chef InSpec profile checks if port 22 is open.

```
control 'Scan Port' do
impact 10.0
title 'Server: Configure the service port'
desc 'Always specify which port the SSH server should listen to.
Prevent unexpected settings.'
describe sshd_config do
its('Port') { should eq('22') }
end
end
```

InSpec includes a collection of resources that help you quickly write checks and auditing controls. InSpec uses the InSpec Domain-specific Language (DSL) for writing these controls in Ruby. You can also use profiles created by a large community of InSpec users. For example, the DevSec chef-os-hardening project on GitHub includes dozens of profiles to help you secure your nodes. You can author and store profiles in GitHub or Amazon S3.

How it works

Here is how the process of using InSpec profiles with Compliance works:

1. Either identify predefined InSpec profiles that you want to use, or create your own. You can use predefined profiles on GitHub to get started. For information about how to create your own InSpec profiles, see ChefChef InSpec Profiles.
2. Store profiles in either a public or private GitHub repository, or in an S3 bucket.
3. Run Compliance with your InSpec profiles by using the Systems Manager document (SSM document) `AWS-RunInspecChecks`. You can begin a Compliance scan by using Run Command, a tool in AWS Systems Manager, for on-demand scans, or you can schedule regular Compliance scans by using State Manager, a tool in AWS Systems Manager.
4. Identify noncompliant nodes by using the Compliance API or the Compliance console.

> **Note**
>
> Note the following information.
>
> - Chef uses a client on your nodes to process the profile. You don't need to install the client. When Systems Manager runs the SSM document `AWS-RunInspecChecks`, the system checks if the client is installed. If not, Systems Manager installs the Chef client during the scan, and then uninstalls the client after the scan is completed.
> - Running the SSM document `AWS-RunInspecChecks`, as described in this topic, assigns a compliance entry of type `Custom:Inspec` to each targeted node. To assign this compliance type, the document calls the PutComplianceItems API operation.

Running an InSpec compliance scan

This section includes information about how to run an InSpec compliance scan by using the Systems Manager console and the AWS Command Line Interface (AWS CLI). The console procedure shows how to configure State Manager to run the scan. The AWS CLI procedure shows how to configure Run Command to run the scan.

Running an InSpec compliance scan with State Manager (console)

To run an InSpec compliance scan with State Manager by using the AWS Systems Manager console

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **State Manager**.
3. Choose **Create association**.
4. In the **Provide association details** section, enter a name.
5. In the **Document** list, choose **AWS-RunInspecChecks**.
6. In the **Document version** list, choose **Latest at runtime**.
7. In the **Parameters** section, in the **Source Type** list, choose either **GitHub** or **S3**.

   If you choose **GitHub**, then enter the path to an InSpec profile in either a public or private GitHub repository in the **Source Info** field. Here is an example path to a public profile provided by the Systems Manager team from the following location: https://github.com/awslabs/amazon-ssm/tree/master/Compliance/InSpec/PortCheck.

   ```
   {"owner":"awslabs","repository":"amazon-ssm","path":"Compliance/InSpec/
   PortCheck","getOptions":"branch:master"}
   ```

   If you choose **S3**, then enter a valid URL to an InSpec profile in an S3 bucket in the **Source Info** field.

   For more information about how Systems Manager integrates with GitHub and Amazon S3, see Running scripts from GitHub.
8. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

9. In the **Specify schedule** section, use the schedule builder options to create a schedule that specifies when you want the Compliance scan to run.

10. For **Rate control**:

    - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

      > **Note**
      >
      > If you selected targets by specifying tags applied to managed nodes or by specifying AWS resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

    - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

11. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

    > **Note**
    >
    > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different AWS account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

12. Choose **Create Association**. The system creates the association and automatically runs the Compliance scan.

13. Wait several minutes for the scan to complete, and then choose **Compliance** in the navigation pane.

14. In **Corresponding managed instances**, locate nodes where the **Compliance Type** column is **Custom:Inspec**.

15. Choose a node ID to view the details of noncompliant statuses.

Running an InSpec compliance scan with Run Command (AWS CLI)

1. Install and configure the AWS Command Line Interface (AWS CLI), if you haven't already.

   For information, see Installing or updating the latest version of the AWS CLI.

2. Run one of the following commands to run an InSpec profile from either GitHub or Amazon S3.

   The command takes the following parameters:

   - **sourceType**: GitHub or Amazon S3
   - **sourceInfo**: URL to the InSpec profile folder either in GitHub or an S3 bucket. The folder must contain the base InSpec file (*.yml) and all related controls (*.rb).

   #### GitHub

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:tag_name","Values":["tag_value"]}]' --parameters '{"sourceType":
   ["GitHub"],"sourceInfo":["{\"owner\":\"owner_name\", \"repository\":
   \"repository_name\", \"path\": \"Inspec.yml_file"}"]}'
   ```

   Here is an example.

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:testEnvironment","Values":["webServers"]}]' --parameters
    '{"sourceType":["GitHub"],"getOptions":"branch:master","sourceInfo":["{\"owner\":
   \"awslabs\", \"repository\":\"amazon-ssm\", \"path\": \"Compliance/InSpec/PortCheck
   \"}"]}'
   ```

   #### Amazon S3

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:tag_name","Values":["tag_value"]}]' --parameters'{"sourceType":
   ["S3"],"sourceInfo":["{\"path\":\"https://s3.aws-api-domain/amzn-s3-demo-
   bucket/Inspec.yml_file\"}"]}'
   ```

Here is an example.

```
aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
 '[{"Key":"tag:testEnvironment","Values":["webServers"]}]' --
parameters'{"sourceType":["S3"],"sourceInfo":["{\"path\":\"https://s3.aws-api-
domain/amzn-s3-demo-bucket/InSpec/PortCheck.yml\"}"]}'
```

3. Run the following command to view a summary of the Compliance scan.

```
aws ssm list-resource-compliance-summaries --filters
 Key=ComplianceType,Values=Custom:Inspec
```

4. Run the following command to see details of a node that isn't compliant.

```
aws ssm list-compliance-items --resource-ids node_ID --resource-type
 ManagedInstance --filters Key=DocumentName,Values=AWS-RunInspecChecks
```

Integrating with ServiceNow

ServiceNow provides a cloud-based service management system to create and manage organization-level workflows, such as for IT services, ticketing systems, and support. The AWS Service Management Connector integrates ServiceNow with Systems Manager to provision, manage, and operate AWS resources from ServiceNow. You can use the AWS Service Management Connector to integrate ServiceNow with Automation, Change Manager, Incident Manager, and OpsCenter, all tools in AWS Systems Manager.

You can perform the following tasks using ServiceNow:

- Run automation playbooks from Systems Manager.
- View, update, and resolve incidents from Systems Manager OpsItems.
- View and manage operational items, such as incidents, through Systems Manager OpsCenter.
- View and run Systems Manager change requests from a curated list of pre-approved change templates.
- Manage and resolve incidents involving AWS hosted applications by integrating with Incident Manager.

Note

For information about how to integrate with ServiceNow, see Configuring AWS service integrations in the *AWS Service Management Connector Administrator Guide*.

AWS Systems Manager reference

The following information and topics can help you better implement AWS Systems Manager solutions.

Principal

In AWS Identity and Access Management (IAM), you can grant or deny a service access to resources using the Principal policy element. The Principal policy element value for Systems Manager is `ssm.amazonaws.eu`.

Supported AWS Regions and endpoints

See Systems Manager service endpoints in the *Amazon Web Services General Reference*.

Service Quotas

See Systems Manager service quotas in the *Amazon Web Services General Reference*.

API Reference

See *AWS Systems Manager API Reference*.

AWS CLI Command Reference

See AWS Systems Manager section of the AWS CLI Command Reference.

AWS Tools for PowerShell Cmdlet Reference

See AWS Systems Manager section of the AWS Tools for PowerShell Cmdlet Reference.

SSM Agent Repository on GitHub

See aws/amazon-ssm-agent.

Using this service with an AWS SDK

AWS software development kits (SDKs) are available for many popular programming languages. Each SDK provides an API, code examples, and documentation that make it easier for developers to build applications in their preferred language.

Reference: Amazon S3 buckets for patching operations

In the course of performing various Patch Manager patching operations, AWS Systems Manager Agent (SSM Agent) accesses certain Amazon Simple Storage Service (Amazon S3) buckets that are owned and maintained by Amazon Web Services (AWS). These S3 buckets are publicly accessible, and by default, SSM Agent connects to them using HTTP calls.

However, if you're using a virtual private cloud (VPC) endpoint in your Systems Manager operations, you must provide explicit permission in an Amazon Elastic Compute Cloud (Amazon EC2) instance profile for Systems Manager, or in a service role for non-EC2 machines in a hybrid and multicloud environment. Otherwise, your resources can't access these public buckets.

This reference topic lists the patching-related buckets for each supported AWS Region.

For information about specifying these S3 buckets in EC2 instance profiles, see SSM Agent communications with AWS managed S3 buckets.

For information about using VPC endpoints with Systems Manager, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager.

Buckets containing SSM Command documents for patching operations (Linux and Windows Server)

Buckets with the format `aws-patch-manager-`*`region`*`-`*`unique-suffix` contain the following documents used by Patch Manager patching operations on the Linux and Windows Server operating systems:

- `AWS-RunPatchBaseline`
- `AWS-RunPatchBaselineAssociation`
- `AWS-RunPatchBaselineWithHooks`
- `AWS-InstanceRebootWithHooks`
- `AWS-PatchAsgInstance`
- `AWS-PatchInstanceWithRollback`

Region name	Region code	**`aws-patch-manager-`*`region`*`-`*`suffix`* bucket**
US East (Ohio)	us-east-2	aws-patch-manager-us-east-2-552881074
US East (N. Virginia)	us-east-1	aws-patch-manager-us-east-1-1970c647d
US West (N. California)	us-west-1	aws-patch-manager-us-west-1-8badb4304
US West (Oregon)	us-west-2	aws-patch-manager-us-west-2-34d7f99f8
Africa (Cape Town)	af-south-1	aws-patch-manager-af-south-1-bdd5f65a9
Asia Pacific (Hong Kong)	ap-east-1	aws-patch-manager-ap-east-1-632356271

Region name	Region code	`aws-patch-manager-region-suffix` bucket
Asia Pacific (Hyderabad)	ap-south-2	aws-patch-manager-ap-south-2-32f4b4128
Asia Pacific (Jakarta)	ap-southeast-3	aws-patch-manager-ap-southeast-3-aa48fc462

Buckets containing AWS managed patch baseline snapshots

Buckets with the format `patch-baseline-snapshot-`*`region`* or `patch-baseline-snapshot-`*`region`*`-`*`unique-suffix`* contain AWS managed patch baseline snapshots. Access to this S3 bucket is required if you use any of the following SSM documents:

- `AWS-RunPatchBaseline`
- `AWS-RunPatchBaselineAssociation`
- `AWS-RunPatchBaselineWithHooks`
- `AWS-ApplyPatchBaseline` (a legacy SSM Document)

Region name	Region code	`patch-baseline-snapshot-*` bucket
US East (Ohio)	us-east-2	patch-baseline-snapshot-us-east-2
US East (N. Virginia)	us-east-1	patch-baseline-snapshot-us-east-1
US West (N. California)	us-west-1	patch-baseline-snapshot-us-west-1
US West (Oregon)	us-west-2	patch-baseline-snapshot-us-west-2
Africa (Cape Town)	af-south-1	patch-baseline-snapshot-af-south-1-tbxdb5b9
Asia Pacific (Hong Kong)	ap-east-1	patch-baseline-snapshot-ap-east-1
Asia Pacific (Hyderabad)	ap-south-2	patch-baseline-snapshot-ap-south-2-50209442
Asia Pacific (Jakarta)	ap-southeast-3	patch-baseline-snapshot-ap-southeast-3-be0a3174

Region name	Region code	`patch-baseline-snapshot-*` bucket
Asia Pacific (Melbourne)	ap-southeast-4	patch-baseline-snapshot-ap-southeast-4-dc6f76ce
Asia Pacific (Mumbai)	ap-south-1	patch-baseline-snapshot-ap-south-1
Asia Pacific (Osaka)	ap-northeast-3	patch-baseline-snapshot-ap-northeast-3
Asia Pacific (Seoul)	ap-northeast-2	patch-baseline-snapshot-ap-northeast-2
Asia Pacific (Singapore)	ap-southeast-1	patch-baseline-snapshot-ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2	patch-baseline-snapshot-ap-southeast-2
Asia Pacific (Tokyo)	ap-northeast-1	patch-baseline-snapshot-ap-northeast-1
Canada (Central)	ca-central-1	patch-baseline-snapshot-ca-central-1
Canada West (Calgary)	ca-west-1	patch-baseline-snapshot-ca-west-1
Europe (Frankfurt)	eu-central-1	patch-baseline-snapshot-eu-central-1
Europe (Ireland)	eu-west-1	patch-baseline-snapshot-eu-west-1

Reference: Amazon EventBridge event patterns and types for Systems Manager

Note

Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides

more features. Changes you make in either CloudWatch or EventBridge are reflected in each console. For more information, see the *Amazon EventBridge User Guide*.

Using Amazon EventBridge, you can create *rules* that match incoming *events* and route them to *targets* for processing.

An event indicates a change in an environment in your own applications, software as a service (SaaS) applications, or an AWS service. Events are produced on a best effort basis. After an event type that is specified in a rule is detected, EventBridge routes it to a specified target for processing. Targets can include Amazon Elastic Compute Cloud (Amazon EC2) instances, AWS Lambda functions, Amazon Kinesis streams, Amazon Elastic Container Service (Amazon ECS) tasks, AWS Step Functions state machines, Amazon Simple Notification Service (Amazon SNS) topics, Amazon Simple Queue Service (Amazon SQS) queues, built-in targets and many more.

For information about creating EventBridge rules, see the following topics:

- Monitoring Systems Manager events with Amazon EventBridge
- Amazon EventBridge event examples for Systems Manager
- Getting started with Amazon EventBridge in the *Amazon EventBridge User Guide*

The remainder of this topic describes the types of Systems Manager events that you can include in your EventBridge rules.

Event type: Automation

Event type name	Description of events you can add to a rule
EC2 Automation Execution Status-change Notification	The overall status of an Automation workflow changes. You can add one or more of the following status changes to an event rule: • Approved • Canceled • Failed • PendingApproval

Event type name	Description of events you can add to a rule
	• PendingChangeCalendarOverride • Rejected • Scheduled • Success • TimedOut
EC2 Automation Step Status-change Notification	The status of a specific step in an Automation workflow changes. You can add one or more of the following status changes to an event rule: • Canceled • Failed • Success • TimedOut

Event type: Change Calendar

Event type name	Description of events you can add to a rule
Calendar State Change	The state of a Change Calendar changes. You can add one or both of the following state changes to an event rule: • OPEN • CLOSED State changes for calendars shared from other AWS accounts aren't supported.

Event type: Change Manager

Change Manager availability change

AWS Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up prior to that date. Existing customers can continue to use the service as normal. For more information, see AWS Systems Manager Change Manager availability change.

Event type name	Description of events you can add to a rule
Change Request Status Update	The state of a Change Manager change request. You can use the following states in an event rule: • Approved • Rejected • InProgress

Event type: Configuration Compliance

Event type name	Description of events you can add to a rule
Configuration Compliance State Change	The state of a managed node changes, for either association compliance or patch compliance. You can add one or more of the following state changes to an event rule: • compliant • non_compliant

Event type: Inventory

Event type name	Description of events you can add to a rule
Inventory Resource State Change	The deletion of custom inventory and a PutInventory call that uses an old schema version. You can add one or more of the following state changes to an event rule: • Custom inventory type deleted event on a specific node. EventBridge sends one event per node per custom InventoryType. • Custom inventory type deleted event for all nodes. • PutInventory call with old schema version event. EventBridge sends this event when the schema version is less than the current schema. This event applies to all inventory types. For more information, see Using EventBridge to monitor Inventory events.

Event type: Maintenance Window

Event type name	Description of events you can add to a rule
Maintenance Window Status-change Notification	The overall status of one or more maintenance windows changes. You can add one or more of the following state changes to an event rule: • DISABLED • ENABLED

Event type name	Description of events you can add to a rule
Maintenance Window Target Registration Notification	The status of one or more maintenance window targets changes. You can add one or more of the following state changes to an event rule: • DEREGISTERED • REGISTERED • UPDATED
Maintenance Window Execution State-change Notification	The overall status of a maintenance window changes while it's running. You can add one or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • PENDING • SKIPPED_OVERLAPPING • SUCCESS • TIMED_OUT

Event type name	Description of events you can add to a rule
Maintenance Window Task Execution State-change Notification	The state of a task in a maintenance window changes while it's running. You can add one or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • SUCCESS • TIMED_OUT
Maintenance Window Task Target Invocation State-change Notification	The state of a maintenance window task on a specific target changes. This notification is fully supported only for Run Command tasks. For this type of task, you can add one or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • SUCCESS • TIMED_OUT For Automation, AWS Lambda, and AWS Step Functions tasks, EventBridge reports only the states `IN_PROGRESS` and `COMPLETE`. `COMPLETE` is reported whether the task is successful or not.

Event type name	Description of events you can add to a rule
Maintenance Window Task Registration Notification	The state of one or more maintenance window tasks changes. You can add one or more of the following state changes to an event rule: • DEREGISTERED • REGISTERED • UPDATED

Event type: OpsCenter

Event type name	Description of events you can add to a rule
OpsItem Create	Occurs when an OpsItem is created. You can add rules for one of the following OpsItem types: • /aws/issue • /aws/task • /aws/insight • /aws/actionitem
OpsItem Update	Occurs when an OpsItem is updated. You can add rules for one of the following OpsItem types: • /aws/issue • /aws/task • /aws/insight • /aws/actionitem

Event type: Parameter Store

Event type name	Description of events you can add to a rule
Parameter Store Change	The state of a parameter changes. You can add one or more of the following state changes to an event rule: • Create • Update • Delete • LabelParameterVersion For more information, see Configuring EventBridge rules for parameters and parameter policies.
Parameter Store Policy Action	A condition of an advanced parameter policy change is met. You can add one or more of the following status changes to an event rule: • Expiration • ExpirationNotification • NoChangeNotification For more information, see Configuring EventBridge rules for parameters and parameter policies.

Event type: Run Command

Event type name	Description of events you can add to a rule
EC2 Command Invocation Status-change Notification	The status of a command sent to an individua l managed instance changes. You can add one

Event type name	Description of events you can add to a rule
	or more of the following status changes to an event rule: • Success • InProgress • TimedOut • Canceled • Failed
EC2 Command Status-change Notification	The overall status of a command changes. You can add one or more of the following status changes to an event rule: • Success • InProgress • TimedOut • Canceled • Failed

Event type: State Manager

Event type name	Description of events you can add to a rule
EC2 State Manager Association State Change	The *overall* state of an Association changes as it's being applied. You can add one or more of the following state changes to an event rule: • Failed • Pending • Success
EC2 State Manager Instance Association State Change	The state of a *single* managed instance that is targeted by an Association changes. You

Event type name	Description of events you can add to a rule
	can add one or more of the following state changes to an event rule: • Failed • Pending • Success

Reference: Cron and rate expressions for Systems Manager

When you create a State Manager association or a maintenance window in AWS Systems Manager, you specify a schedule for when the window or the association should run. You can specify a schedule as either a time-based entry, called a *cron expression*, or a frequency-based entry, called a *rate expression*.

General information about cron and rate expressions

The following information applies to cron and rate expressions for both maintenance windows and associations.

Single-run schedules

When you create an association or a maintenance window, you can specify a timestamp in Coordinated Universal Time (UTC) format so that it runs once at the specified time. For example: `"at(2020-07-07T15:55:00)"`

Schedule offsets

Associations and maintenance windows support *schedule offsets* for cron expressions only. A schedule offset is the number of days to wait after the date and time specified by a cron expression before running the association or maintenance window.

Maintenance window example

In the following command, the cron expression schedules a maintenance window to run the third Tuesday of every month at 11:30 PM. However, because the schedule offset is 2, the maintenance window won't run until 11:30 PM two days later.

```
aws ssm create-maintenance-window \
```

```
    --name "My-Cron-Offset-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "cron(30 23 ? * TUE#3 *)" \
    --duration 4 \
    --cutoff 1 \
    --schedule-offset 2
```

Association example

In the following command, the cron expression schedules an association to run the second Thursday of each month. However, because the schedule offset is 3, the assocation won't run until the next Sunday, three days later.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "cron(0 0 ? * THU#2 *)"  \
    --schedule-offset 3
    --apply-only-at-cron-interval
```

> **Note**
>
> To use an offset with an assocation, you must specify the `--apply-only-at-cron-interval` option. This option tells the system not to run an association immediately after you create it.

If you create an association or a maintenance window with a cron expression that targets a day that has already passed in the current period, but add a schedule offset date that falls in the future, the association or maintenance window won't run in the period. It will go into effect in the following period. For example, if you specify a cron expression that would have run a maintenance window yesterday and add a schedule offset of two days, the maintenance window won't run tomorrow.

Required fields

Cron expressions for maintenance windows have six required fields. Cron expressions for associations have five. (State Manager doesn't currently support specifying months in cron expressions for associations.) An additional field, the `Seconds` field (the first in a cron expression), is optional. Fields are separated by a space.

Cron expression examples

Minutes	Hours	Day of month	Month	Day of week	Year	Meaning
0	10	*	*	?	*	Run at 10:00 am (UTC) every day
15	12	*	*	?	*	Run at 12:15 PM (UTC) every day
0	18	?	*	MON-FRI	*	Run at 6:00 PM (UTC) every Monday through Friday (maintenance windows only)
0	8	1	*	?	*	Run at 8:00 AM (UTC) every 1st day of the month

> **Note**
>
> Day-of-week ranges (such as `MON-FRI`) and comma-separated day lists (such as `MON,TUE,WED`) are supported for maintenance windows only. For associations, you must specify a single day (such as `MON`) or use `*` for every day.

Supported values

The following table shows supported values for required cron entries.

Supported values for cron expressions

Field	Values	Wildcards
Minutes	0-59	, - * /
Hours	0-23	, - * /
Day-of-month	1-31	, - * ? / L W
Month (maintenance windows only)	1-12 or JAN-DEC	, - * /
Day-of-week	1-7 or SUN-SAT	, - * ? / L #
Year	1970-2199	, - * /

> **Note**
>
> You can't specify a value in the day-of-month and in the day-of-week fields in the same cron expression. If you specify a value in one of the fields, use a ? (question mark) in the other field.

Wildcards for cron expressions

The following table shows the wildcard values that cron expressions support.

> **Note**
>
> Cron expressions that lead to rates faster than five (5) minute aren't supported. Support for specifying both a day-of-week and a day-of-month value isn't complete. Use the question mark (?) character in one of these fields.

Supported wildcards for cron expressions

Wildcard	Description
,	The , (comma) wildcard includes additiona l values. In the Month field, JAN,FEB,MAR would include January, February, and March.
-	The - (dash) wildcard specifies ranges. In the Day field, 1-15 would include days 1 through 15 of the specified month.
*	The * (asterisk) wildcard includes all values in the field. In the Hours field, * would include every hour.
/	The / (forward slash) wildcard specifies increments. In the Minutes field, you could enter 1/10 to specify every tenth minute, starting from the first minute of the hour. So 1/10 specifies the first, 11th, 21st, and 31st minute, and so on.
?	The ? (question mark) wildcard specifies one or another. In the Day-of-month field you could enter 7 and if you didn't care what day of the week the 7th was, you could enter ? in the Day-of-week field.

Wildcard	Description
L	The `L` wildcard in the Day-of-month or Day-of-week fields specifies the last day of the month or week.
W	The `W` wildcard in the Day-of-month field specifies a weekday. In the Day-of-month field, 3W specifies the day closest to the third weekday of the month.
#	The # wildcard in the day-of-week field followed by a number between one and five specifies a given day of the month. 5#3 specifies the 3rd Thursday of the month.

Rate expressions

Rate expressions have the following two required fields. Fields are separated by spaces.

Required fields for rate expressions

Field	Values
Value	positive number, such as 1 or 15

Unit	`minute`
	`minutes`
	`hour`
	`hours`
	`day`
	`days`

If the value is equal to 1, then the unit must be singular. Similarly, for values greater than 1, the unit must be plural. For example, `rate(1 hours)` and `rate(5 hour)` aren't valid, but `rate(1 hour)` and `rate(5 hours)` are valid.

Topics

- Cron and rate expressions for associations
- Cron and rate expressions for maintenance windows

Cron and rate expressions for associations

This section includes examples of cron and rate expressions for State Manager associations. Before you create one of these expressions, be aware of the following information:

- Associations support the following cron expressions: Every 1/2, 1, 2, 4, 8, or 12 hours; every day, every week, or every specified day and time of the week; a specific day in a specific week of the month, or the last `x` day of the month at a specific time.
- Associations support the following rate expressions: intervals of 30 minutes or greater and less than 31 days.
- If you specify the optional `Seconds` field, its value can be 0 (zero). For example: `cron(0 */30 * * * ? *)`
- For an association that collects metadata for Inventory, a tool in AWS Systems Manager, we recommend using a rate expression.
- State Manager doesn't currently support specifying months in cron expressions for associations.

Associations support cron expressions that include a day of the week and the number sign (#) to designate the *n*th day of a month to run an association. Here is an example that runs a cron schedule on the third Tuesday of every month at 23:30 UTC:

```
cron(30 23 ? * TUE#3 *)
```

Here is an example that runs on the second Thursday of every month at midnight UTC:

```
cron(0 0 ? * THU#2 *)
```

Associations also support the (L) sign to indicate the last *X* day of the month. Here is an example that runs a cron schedule on the last Tuesday of every month at midnight UTC:

```
cron(0 0 ? * 3L *)
```

To further control when an association runs, for example if you want to run an association two days after patch Tuesday, you can specify an offset. An *offset* defines how many days to wait after the scheduled day to run an association. For example, if you specified a cron schedule of `cron(0 0 ? * THU#2 *)`, you could specify the number 3 in the **Schedule offset** field to run the association each Sunday after the second Thursday of the month.

To use offsets, you must either choose the **Apply association only at the next specified Cron interval** option in the console or you must specify the use `--apply-only-at-cron-interval` parameter from the command line. This option tells State Manager not to run an association immediately after you create it.

The following table presents cron examples for associations.

Cron examples for associations

Example	Details
cron(0/30 * * * ? *)	Every 30 minutes
cron(0 0/1 * * ? *)	Every hour
cron(0 0/2 * * ? *)	Every 2 hours
cron(0 0/4 * * ? *)	Every 4 hours
cron(0 0/8 * * ? *)	Every 8 hours
cron(0 0/12 * * ? *)	Every 12 hours
cron(15 13 ? * * *)	Every day at 1:15 PM
cron(15 13 ? * MON *)	Every Monday at 1:15 PM
cron(30 23 ? * TUE#3 *)	The third Tuesday of every month at 11:30 PM

Here are some rate examples for associations.

Rate examples for associations

Example	Details
rate(30 minutes)	Every 30 minutes
rate(1 hour)	Every hour
rate(5 hours)	Every 5 hours
rate(15 days)	Every 15 days

AWS CLI examples for associations

To create State Manager associations using the AWS CLI, you include the `--schedule-expression` parameter with a cron or rate expression. The following examples use the AWS CLI on a local Linux machine.

> **Note**
>
> By default, when you create a new association, the system runs it immediately after it's created and then according to the schedule you specified. Specify `--apply-only-at-cron-interval` so that the association doesn't run immediately after you create it. This parameter isn't supported for rate expressions.

```
aws ssm create-association \
    --association-name "My-Cron-Association" \
    --schedule-expression "cron(0 2 ? * SUN *)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent
```

```
aws ssm create-association \
    --association-name "My-Rate-Association" \
    --schedule-expression "rate(7 days)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent
```

```
aws ssm create-association \
```

```
    --association-name "My-Rate-Association" \
    --schedule-expression "at(2020-07-07T15:55:00)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent \
    --apply-only-at-cron-interval
```

Cron and rate expressions for maintenance windows

This section includes examples of cron and rate expressions for maintenance windows.

Unlike State Manager associations, maintenance windows support all cron and rate expressions. This includes support for values in the seconds field.

For example, the following 6-field cron expression runs a maintenance window at 9:30 AM every day.

```
cron(30 09 ? * * *)
```

By adding a value to the Seconds field, the following 7-field cron expression runs a maintenance window at 9:30:24 AM every day.

```
cron(24 30 09 ? * * *)
```

The following table provides additional 6-field cron examples for maintenance windows.

Cron examples for maintenance windows

Example	Details
cron(0 2 ? * THU#3 *)	02:00 AM the third Thursday of every month
cron(15 10 ? * * *)	10:15 AM every day
cron(15 10 ? * MON-FRI *)	10:15 AM every Monday, Tuesday, Wednesday, Thursday and Friday
cron(0 2 L * ? *)	02:00 AM on the last day of every month
cron(15 10 ? * 6L *)	10:15 AM on the last Friday of every month

The following table provides rate examples for maintenance windows.

Rate examples for maintenance windows

Example	Details
rate(30 minutes)	Every 30 minutes
rate(1 hour)	Every hour
rate(5 hours)	Every 5 hours
rate(25 days)	Every 25 days

AWS CLI examples for maintenance windows

To create maintenance windows using the AWS CLI, you include the `--schedule` parameter with a cron or rate expression or a timestamp. The following examples use the AWS CLI on a local Linux machine.

```
aws ssm create-maintenance-window \
    --name "My-Cron-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "cron(0 16 ? * TUE *)" \
    --schedule-timezone "America/Los_Angeles" \
    --start-date 2021-01-01T00:00:00-08:00 \
    --end-date 2021-06-30T00:00:00-08:00 \
    --duration 4 \
    --cutoff 1
```

```
aws ssm create-maintenance-window \
    --name "My-Rate-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "rate(7 days)" \
    --duration 4 \
    --schedule-timezone "America/Los_Angeles" \
    --cutoff 1
```

```
aws ssm create-maintenance-window \
    --name "My-TimeStamp-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "at(2021-07-07T13:15:30)" \
```

```
    --duration 4 \
    --schedule-timezone "America/Los_Angeles" \
    --cutoff 1
```

More info

CRON expression at the *Wikipedia website*

Reference: ec2messages, ssmmessages, and other API operations

If you monitor API operations, you might see calls to the following operations:

- `ec2messages:AcknowledgeMessage`
- `ec2messages:DeleteMessage`
- `ec2messages:FailMessage`
- `ec2messages:GetEndpoint`
- `ec2messages:GetMessages`
- `ec2messages:SendReply`
- `ssmmessages:CreateControlChannel`
- `ssmmessages:CreateDataChannel`
- `ssmmessages:OpenControlChannel`
- `ssmmessages:OpenDataChannel`
- `ssm:DescribeDocumentParameters`
- `ssm:DescribeInstanceProperties`
- `ssm:GetCalendar`
- `ssm:GetManifest`
- `ssm:ListInstanceAssociations`
- `ssm:PutCalendar`
- `ssm:PutConfigurePackageResult`
- `ssm:RegisterManagedInstance`
- `ssm:RequestManagedInstanceRoleToken`

- ssm:UpdateInstanceAssociationStatus
- ssm:UpdateInstanceInformation
- ssm:UpdateManagedInstancePublicKey

These are special operations used by AWS Systems Manager, as described in the rest of this topic.

Agent-related API operations (ssmmessages and ec2messages endpoints)

ssmmessages API operations

Systems Manager uses the ssmmessages endpoint for the following types of API operations:

- Operations from Systems Manager Agent (SSM Agent) to the Systems Manager service in the cloud.
- Operations from SSM Agent to Session Manager, a tool in AWS Systems Manager, in the cloud. This endpoint is required to create and delete session channels with the Session Manager service in the cloud. Additionally, if connectivity is allowed, SSM Agent receives Command documents through this Amazon Message Gateway Service. If connectivity is not allowed, SSM Agent receives Command documents through the Amazon Message Delivery Service. For more information, see Actions, resources, and condition keys for Amazon Message Gateway Service.

  > **Note**
  >
  > If the ssmmessages:OpenControlChannel permission is removed from policies attached to your IAM instance profile or IAM service role,SSM Agent on the managed node loses connectivity to the Systems Manager service in the cloud. However, it can take up to 1 hour for a connection to be terminated after the permission is removed. This is the same behavior as when the IAM instance role or IAM service role is deleted.
  > Note that the ssmmessages:OpenControlChannel permission is included in the managed policy AmazonSSMManagedInstanceCore, which is used in the instructions for creating an IAM instance profile for EC2 instances and for creating an IAM service role for non-EC2 instances.

- Operations from Run Command.

ec2messages API operations

`ec2messages:*` API operations are made to the Amazon Message Delivery Service endpoint. Systems Manager uses this endpoint for API operations from Systems Manager Agent (SSM Agent) to the Systems Manager service in the cloud.

> **Important**
>
> `ec2messages:*` API operations are supported only in AWS Regions that launched before 2024. In Regions launched in 2024 and later, only `ssmmessages:*` API operations are supported.

Endpoint connection precedence

Beginning with version 3.3.40.0 of SSM Agent, Systems Manager began using the `ssmmessages:*` endpoint (Amazon Message Gateway Service) whenever available instead of the `ec2messages:*` endpoint (Amazon Message Delivery Service).

If you provide access to `ssmmessages:*` in your AWS Identity and Access Management (IAM) permission policies, SSM Agent connects to the `ssmmessages:*` endpoint, even if your IAM instance profile is configured to allow both endpoints. This includes policies for IAM instance profiles and IAM service roles you have created yourself, and for IAM instance profiles created by the Quick Setup Host management configuration and Default Host Management Configuration.

If you have provided permissions for both endpoints and monitor API operations using, for example, CloudWatch Metrics, you will see no calls to `ec2messages:*`.

For AWS Regions launched before 2024: You can safely remove `ec2messages:*` permissions from your policies at this time.

Endpoint connection failover

For AWS Regions launched before 2024 only: If your IAM instance profile does not provide permissions for `ssmmessages:*` at the time the agent starts, but only `ec2messages:*`, SSM Agent connects to the `ec2messages:*` endpoint. If you have both `ssmmessages:*` and `ec2messages:*` at the time SSM Agent starts, but remove `ssmmessages:*` after the agent starts, SSM Agent soon switches the connection to the `ec2messages:*` endpoint. For Regions launched in 2024 and later, only the `ssmmessages:*` endpoint is supported.

For more information about the `ssmmessages` and `ec2messages:*` endpoints, see the following topics in the *AWS Service Authorization Reference*.

- Actions, resources, and condition keys for Amazon Message Gateway Service (`ssmmessages`).
- Actions, resources, and condition keys for Amazon Message Delivery Service (`ec2messages:*`)

`ssm:*` namespace instance-related API operations

`DescribeDocumentParameters`

Systems Manager runs this API operation to render specific nodes in the Amazon EC2 console. Results of the `DescribeDocumentParameters` operation are displayed in the Documents node.

`DescribeInstanceProperties`

Systems Manager runs this API operations to render specific nodes in the Amazon EC2 console. Results of the `DescribeInstanceProperties` operation are displayed in the Fleet Manager node.

`GetCalendar`

Systems Manager runs this API operation to render Change Calendar type documents in the Change Calendar console.

`GetManifest`

SSM Agent runs this API operation to determine system requirements for installing or updating a specified version of an AWS Systems Manager Distributor package. This is a legacy API operation and not available in AWS Regions launched after 2017.

`ListInstanceAssociations`

SSM Agent runs this API operation to see if a new State Manager association is available. This API operation is required for State Manager to function.

`PutCalendar`

Systems Manager runs this API operation to update Change Calendar type documents in the Change Calendar console.

`PutConfigurePackageResult`

SSM Agent runs this API operation to publish installation error and latency metrics for public Distributor packages to the package owner's account.

`RegisterManagedInstance`

SSM Agent runs this API operation for the following scenarios:

- To register an on-premises server or virtual machine (VM) with Systems Manager as a managed instance using an activation code and ID.
- To register AWS IoT Greengrass Version 2 credentials.

This operation is also called by Amazon EC2 instances running SSM Agent version 3.1.x or later.

`RequestManagedInstanceRoleToken`

SSM Agent runs this API operation to retrieve temporary credentials to access the managed node.

`UpdateInstanceAssociationStatus`

SSM Agent runs this API operation to update an association. This API operation is required for State Manager, a tool in AWS Systems Manager, to function.

`UpdateInstanceInformation`

SSM Agent calls the Systems Manager service in the cloud every 5 minutes to provide heartbeat information. This call is necessary to maintain a heartbeat with the agent so that the service knows the agent is functioning as expected.

`UpdateManagedInstancePublicKey`

SSM Agent runs this API operation to provide the public key after rotating the key pair on the managed node. The public key is used to authenticate the requests, signed with the private key, to get temporary credentials from Systems Manager.

ssm:* namespace other API operations

`ExecuteApi`

Systems Manager delegated administrators who manage OpsItems in OpsCenter require access to this API action so they can view related resource details about OpsItems across multiple AWS accounts. Specifically, this API gives a delegated administrator permission to view the following OpsItem details in the AWS Management Console: the OpsItem description, tags, CloudFormation template, AWS Config changes, CloudWatch Logs alarms, and AWS CloudTrail events. For more information about working with OpsItems across accounts, see (Optional) Manually set up OpsCenter to centrally manage OpsItems across accounts. For more

information about related resource details for OpsItems, see Adding related resources to an OpsItem.

Reference: Date and time string formats for Systems Manager

AWS Systems Manager API operations accept filters to limit the number of results returned by a request. Some of these API operations accept filters that require a formatted string to represent a specific date and time. For example, the `DescribeSessions` API operation accepts the `InvokedAfter` and `InvokedBefore` keys as some valid values for a `SessionFilter` object. Another example is the `DescribeAutomationExecutions` API operation, which accepts the `StartTimeBefore` and `StartTimeAfter` keys as some valid values for an `AutomationExecutionFilter` object. The values you provide for these keys when filtering your requests must match the ISO 8601 standard. For information about ISO 8601, see ISO 8601.

These formatted date and time strings aren't limited to filters. There are also API operations that require an ISO 8601 formatted string to represent a specific date and time when providing a value for a request parameter. For example, the `AtTime` request parameter for the `GetCalendarState` operation. These strings are difficult to create. Use the examples in this topic to create formatted date and time strings to use with Systems Manager API operations.

Formatting date and time strings for Systems Manager

The following is an example of an ISO 8601 formatted date and time string.

```
2024-05-08T15:16:43Z
```

This represents May 8, 2024 at 15:16 Coordinated Universal Time (UTC). The calendar date portion of the string is represented by a four-digit year, two-digit month, and two-digit day separated by hyphens. This can be represented in the following format.

```
YYYY-MM-DD
```

The time portion of the string begins with the letter "T" as a delimiter, and then is represented by a two-digit hour, two-digit minute, and two-digit second separated by colons. This can be represented in the following format.

```
hh:mm:ss
```

The time portion of the string ends with the letter "Z", denoting the UTC standard.

Creating custom date and time strings for Systems Manager

You can create custom date and time strings from your local machine using your preferred command line tool. The syntax you use to create an ISO 8601 formatted date and time string differs depending on your local machine's operating system. The following are examples of how you can use `date` from GNU's coreutils on Linux, or PowerShell on Windows to create an ISO 8601 formatted date and time string.

coreutils

```
date '+%Y-%m-%dT%H:%M:%SZ'
```

PowerShell

```
(Get-Date).ToString("yyyy-MM-ddTH:mm:ssZ")
```

When working with Systems Manager API operations, you might need to create historical date and time strings for reporting or troubleshooting purposes. The following are examples of how you can create and use custom historical ISO 8601 formatted date and time strings for the AWS Tools for PowerShell and AWS Command Line Interface (AWS CLI).

AWS CLI

- Retrieve the last week of command history for an SSM document.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '7 days ago')

docFilter='{"key":"DocumentName","value":"AWS-RunPatchBaseline"}'
timeFilter='{"key":"InvokedAfter","value":'\"$lastWeekStamp\"'}'

commandFilters=[$docFilter,$timeFilter]

aws ssm list-commands \
    --filters $commandFilters
```

- Retrieve the last week of automation execution history.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '7 days ago')
```

```
aws ssm describe-automation-executions \
    --filters Key=StartTimeAfter,Values=$lastWeekStamp
```

- Retrieve the last month of session history.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '30 days ago')

aws ssm describe-sessions \
    --state History \
    --filters key=InvokedAfter,value=$lastWeekStamp
```

AWS Tools for PowerShell

- Retrieve the last week of command history for an SSM document.

```
$lastWeekStamp = (Get-Date).AddDays(-7).ToString("yyyy-MM-ddTH:mm:ssZ")

$docFilter = @{
    Key="DocumentName"
    Value="AWS-InstallWindowsUpdates"
}
$timeFilter = @{
    Key="InvokedAfter"
    Value=$lastWeekStamp
}

$commandFilters = $docFilter,$timeFilter

Get-SSMCommand `
    -Filters $commandFilters
```

- Retrieve the last week of automation execution history.

```
$lastWeekStamp = (Get-Date).AddDays(-7).ToString("yyyy-MM-ddTH:mm:ssZ")

Get-SSMAutomationExecutionList `
    -Filters @{Key="StartTimeAfter";Values=$lastWeekStamp}
```

- Retrieve the last month of session history.

```
$lastWeekStamp = (Get-Date).AddDays(-30).ToString("yyyy-MM-ddTH:mm:ssZ")
```

```
Get-SSMSession `
    -State History `
    -Filters @{Key="InvokedAfter";Value=$lastWeekStamp}
```

Use cases and best practices

This topic lists common use cases and best practices for AWS Systems Manager tools. If available, this topic also includes links to relevant blog posts and technical documentation.

> **Note**
>
> The title of each section here is an active link to the corresponding section in the technical documentation.

Automation

- Create self-service Automation runbooks for infrastructure.
- Use Automation, a tool in AWS Systems Manager, to simplify creating Amazon Machine Images (AMIs) from the AWS Marketplace or custom AMIs, using public Systems Manager documents (SSM documents) or by authoring your own workflows.
- Build and maintain AMIs using the `AWS-UpdateLinuxAmi` and `AWS-UpdateWindowsAmi` Automation runbooks, or using custom Automation runbooks that you create.

Compliance

- As a security best practice, we recommend that you update the AWS Identity and Access Management (IAM) role used by your managed nodes to restrict the node's ability to use the PutComplianceItems API action. This API action registers a compliance type and other compliance details on a designated resource, such as an Amazon EC2 instance or a managed node. For more information, see Configuring permissions for Compliance.

Inventory

- Use Inventory, a tool in AWS Systems Manager, with AWS Config to audit your application configurations over time.

Maintenance Windows

- Define a schedule to perform potentially disruptive actions on your nodes such as operating system (OS) patching, driver updates, or software installations.
- For information about the differences between State Manager and Maintenance Windows, tools of AWS Systems Manager, see Choosing between State Manager and Maintenance Windows.

Parameter Store

- Use Parameter Store, a tool in AWS Systems Manager, to centrally manage global configuration settings.
- How AWS Systems Manager Parameter Store uses AWS KMS.
- Reference AWS Secrets Manager secrets from Parameter Store parameters.

Patch Manager

- Use Patch Manager, a tool in AWS Systems Manager, to roll out patches at scale and increase fleet compliance visibility across your nodes.
- Integrate Patch Manager with AWS Security Hub CSPM to receive alerts when nodes in your fleet go out of compliance and monitor the patching status of your fleets from a security point of view. There is a charge to use Security Hub CSPM. For more information, see Pricing.
- Use only one method at a time for scanning managed nodes for patch compliance to avoid unintentionally overwriting compliance data.

Run Command

- Manage Instances at Scale without SSH Access Using EC2 Run Command.
- Audit all API calls made by or on behalf of Run Command, a tool in AWS Systems Manager, using AWS CloudTrail.
- When you send a command using Run Command, don't include sensitive information formatted as plaintext, such as passwords, configuration data, or other secrets. All Systems Manager API activity in your account is logged in an S3 bucket for AWS CloudTrail logs. This means that any user with access to S3 bucket can view the plaintext values of those secrets. For this reason, we recommend creating and using `SecureString` parameters to encrypt sensitive data you use in your Systems Manager operations.

For more information, see Restricting access to Parameter Store parameters using IAM policies.

> **Note**
>
> By default, the log files delivered by CloudTrail to your bucket are encrypted by Amazon server-side encryption with Amazon S3-managed encryption keys (SSE-S3). To provide a security layer that is directly manageable, you can instead use server-side encryption with AWS KMS–managed keys (SSE-KMS) for your CloudTrail log files.
> For more information, see Encrypting CloudTrail log files with AWS KMS–managed keys (SSE-KMS) in the *AWS CloudTrail User Guide*.

- Use the targets and rate control features in Run Command to perform a staged command operation.
- Use fine-grained access permissions for Run Command (and all Systems Manager tools) by using AWS Identity and Access Management (IAM) policies.

Session Manager

- Log session activity in your AWS account using AWS CloudTrail.
- Log session data in your AWS account using Amazon CloudWatch Logs or Amazon S3.
- Control user session access to instances.
- Restrict access to commands in a session.
- Turn off or turn on ssm-user account administrative permissions.

State Manager

- Update SSM Agent at least once a month using the pre-configured `AWS-UpdateSSMAgent` document.
- (Windows) Upload the PowerShell or DSC module to Amazon Simple Storage Service (Amazon S3), and use `AWS-InstallPowerShellModule`.
- Use tags to create application groups for your nodes. And then target nodes using the `Targets` parameter instead of specifying individual node IDs.
- Automatically remediate findings generated by Amazon Inspector by using Systems Manager.

- Use a centralized configuration repository for your SSM documents, and share documents across your organization.
- For information about the differences between State Manager and Maintenance Windows, see Choosing between State Manager and Maintenance Windows.

Managed nodes

- Systems Manager requires accurate time references to perform its operations. If your node's date and time aren't set correctly, they might not match the signature date of your API requests. This might lead to errors or incomplete functionality. For example, nodes with incorrect time settings won't be included in your lists of managed nodes.

  For information about setting the time on your nodes, see Set the time for your Amazon EC2 instance.
- On Linux managed nodes, verify the signature of SSM Agent.

More info

- Security best practices for Systems Manager

Deleting Systems Manager resources and artifacts

As a best practice, we recommend that you delete Systems Manager resources and artifacts if you no longer need to view data about those resources or use the artifacts in any way. The following table lists each Systems Manager tool or artifact and a link to more information about deleting the resources or artifacts created by Systems Manager.

Capability or artifact	Details
Application Manager	You can't delete an application in Application Manager, but you can remove an application from the service by deleting the underlying tags, Resource Groups, or AWS CloudFormation stacks.
Automation	If you create AWS resources by using Systems Manager Automation, you must manually

Capability or artifact	Details
	delete those resources by using the correspon ding AWS Management Console. If you created a custom runbook, you can delete the underlying SSM document. For more informati on, see Deleting custom SSM documents.
Change Calendar	You can delete a change calendar and a change calendar event. For more information, see Deleting a change calendar and Deleting a Change Calendar event.
Change Manager	You can delete a change template. For more information, see Deleting change templates.
Compliance	Systems Manager Compliance automatic ally displays compliance data about Patch Manager patching and State Manager associati ons. You can't delete this data. If you configure d a resource data sync to centralize complianc e data in an S3 bucket, you can delete the sync. For more information, see Deleting a resource data sync for Compliance.
Distributor	You can delete packages in Distributor. For more information, see Delete a Distributor package.

Capability or artifact	Details
Explorer	You can disconnect from the sources from which Explorer collects OpsData. For more information, see Editing Systems Manager Explorer data sources. You can also delete a resource data sync used by Explorer to aggregate OpsData and OpsItems from multiple AWS Regions and accounts to a single Amazon Simple Storage Service (Amazon S3) bucket. For more information, see Deleting a Systems Manager Explorer resource data sync. For information about deleting an S3 bucket, see Deleting a bucket in the *Amazon Simple Email Service Developer Guide*.
Fleet Manager	You can't delete a managed node by using Fleet Manager. You must use Amazon Elastic Compute Cloud (Amazon EC2). For more information, see Terminate your instance (Linux) and Terminate your instance (Windows) .

Capability or artifact	Details
Inventory	You can stop Inventory data collection by deleting the State Manager associations that define the schedule and the resources from which to collect metadata. For more informati on, see Stopping data collection and deleting inventory data. If you no longer want to use AWS Systems Manager Inventory to view metadata about your AWS resources, then we also recommend deleting resource data syncs used for inventory data collection. For more informati on, see Deleting an Inventory resource data sync.
Maintenance Windows	You can delete a maintenance window, a maintenance window target, and a maintenan ce window task. For more information, see Update or delete maintenance window resources using the console.
OpsCenter	You can delete an individual OpsItem by calling the DeleteOpsItem API operation using the AWS Command Line Interface or the AWS SDK. You can't delete an OpsItem in the AWS Management Console. For more information, see Delete OpsItems.
Parameter Store	You can delete a parameter that you have created. For more information, see Deleting parameters from Parameter Store.
Patch Manager	You can delete a custom patch baseline. For more information, see Updating or deleting a custom patch baseline.

Capability or artifact	Details
Quick Setup	You can delete associations created by Quick Setup. The associations are stored and processed by State Manager. For more information, see Deleting associations.
Run Command	After a command finishes processin g, information about it is stored in the **Command history** tab. You can't delete information from the **Command history** tab.
Automation	After an automation finishes processing, information about it is stored in the **Execution s** tab. You can't delete information from the **Executions** tab.
Service-linked role	Systems Manager automatically creates service-linked roles for some tools. You can delete these roles. For more information, see Deleting the `AWSServiceRoleForA mazonSSM` service-linked role for Systems Manager.
Session Manager	Session Manager doesn't retain data about your resources after you terminate a session. To terminate a session, see End a session.
SSM Agent	You can manually uninstall SSM Agent from your nodes. For more information, see the following topics. • Linux: Manually installing and uninstalling SSM Agent on EC2 instances for Linux • macOS: Manually installing and uninstalling SSM Agent on EC2 instances for macOS • Windows Server: Open **Control panel** and then choose **Add/remove programs**.

Capability or artifact	Details
State Manager	You can delete an association. For more information, see Deleting associations.
Systems Manager document service	You can't delete runbooks provided by AWS or AWS Support, but you can delete custom runbooks. For more information, see Deleting custom SSM documents.

Choosing between State Manager and Maintenance Windows

State Manager and Maintenance Windows, both tools in AWS Systems Manager, can perform some similar types of updates on your managed nodes. Which one you choose depends on whether you need to automate system compliance or perform high-priority, time-sensitive tasks during periods you specify.

State Manager and Maintenance Windows: Key use cases

State Manager, a tool in AWS Systems Manager, sets and maintains the targeted state configuration for managed nodes and AWS resources within your AWS account. You can define combinations of configurations and targets as association objects. State Manager is the recommended tool if you want to maintain all managed nodes in your account in a consistent state, use Amazon EC2 Auto Scaling to generate new nodes, or have strict compliance reporting requirements for the managed nodes in your account.

The main use cases for State Manager are as follows:

- **Auto Scaling scenarios:** State Manager can monitor all new nodes launched within an account either manually or through Auto Scaling groups. If there are any associations in the account targeting that new node (through tags or all nodes), then that particular association is automatically applied to the new node.
- **Compliance reporting:** State Manager can drive compliance reporting of required states for resources in your account.
- **Supporting all nodes:** State Manager can target all nodes within a given account.

A **maintenance window** takes one or more actions on AWS resources within a given time window. You can define a single maintenance window with start and end times. You can specify multiple tasks to run within this maintenance window. Use Maintenance Windows, a tool in AWS Systems Manager, if your high priority operations include patching your managed nodes, running multiple types of tasks on your nodes during an update period, or controlling when update operations can be run on your nodes.

The main use cases for Maintenance Windows are as follows:

- **Running multiple documents:** Maintenance windows can run multiple tasks. Each task can use a different document type. As a result, you can build complex workflows using different tasks within a single maintenance window.
- **Patching:** A maintenance window can provide patching support for all managed nodes in a single Region that are tagged with a specific tag or resource group. Because patching usually involves bringing down nodes (for example, removing nodes from a load balancer), patching, and post processing (putting nodes back into production), patching can be achieved as a series of tasks within a given patch time window.

  > **Note**
  >
  > Using a maintenance window, your patching operation is limited to a single Region in a single account. Using a patch policy created in Quick Setup, a tool in Systems Manager, you can instead configure patching for some or all accounts and Regions in an organization created in AWS Organizations. For more information, see Patch policy configurations in Quick Setup.

- **Window actions:** Maintenance windows can make one or more sets of actions start within a specific time window. Maintenance windows won't start outside of that window. Actions already started continue until finished, even if they finish outside of the time window.

The following table compares the main features of State Manager and Maintenance Windows.

Feature	State Manager	Maintenance Windows
CloudFormation integration	AWS CloudFormation templates support State Manager associations.	CloudFormation templates support maintenance

Feature	State Manager	Maintenance Windows
		windows, window targets, and window tasks.
Compliance	Every State Manager associati on reports compliance with respect to the required state of the targeted resource. You can use the Compliance Dashboard to aggregate and view the reported complianc e.	Not applicable.
Configuration Management integration	State Manager supports external targeted state solutions such as Microsoft PowerShell Desired State Configuration (DSC), Ansible playbooks, and Chef recipes. You can use State Manager associations to test that the Configuration Management solutions work and to apply their configuration changes to your nodes when you're ready.	Not applicable.

Feature	State Manager	Maintenance Windows
Documents	State Manager configurations can be defined as Policy documents (for gathering inventory information), Automation runbooks, for AWS resources such as Amazon Simple Storage Service (Amazon S3) buckets, or Systems Manager Command documents (SSM documents) for managed nodes.	Maintenance Windows configurations can be defined as automation documents (multi-step actions with optional approval workflows) or SSM documents (required state for managed nodes).
Monitoring	State Manager monitors changes in the configuration, association, or state of a node (for example, new nodes coming online). When State Manager detects these changes, the given association is re-applied to the nodes originally targeted with that association.	Not applicable.

Feature	State Manager	Maintenance Windows
Priorities within tasks	Not applicable.	Tasks within a maintenance window can be assigned a priority. All tasks with the same priority are run in parallel. Tasks with lower priorities are run after tasks with higher priorities reach a final state. There is no way to conditionally run tasks. After a higher priority task reaches its final state, the next priority task runs, regardless of the state of the previous task.
Safety controls	State Manager supports two safety controls when deploying configurations across a large fleet. You can use maximum concurrency to define how many concurrent nodes or resources should have the configuration applied. You can define a maximum error rate which can be used to pause the State Manager association if a certain number or percentage of errors occur across the fleet.	Maintenance windows support two safety controls when deploying configurations across a large fleet. You can use maximum concurrency to define how many concurrent nodes or resources should have the configuration applied. You can define a maximum error rate which can be used to pause the actions in a maintenance window if a certain number or percentage of errors occur across the fleet.

Feature	State Manager	Maintenance Windows
Scheduling	You can run State Manager associations on demand, at a particular cron interval, at a given rate, or after they're created. This is useful if you want to maintain the required state of your resources in a consistent and timely manner. **Important** Cron expressions for State Manager associations do not support the months field, such as `03` or `MAR` for the month of March. If you require monthly or quarterly configuration updates, a maintenance window can best meet your needs. For more information, see Reference: Cron and rate expressions for Systems Manager.	Maintenance windows support several scheduling options including `at` expressions (for example, `"at(2021-07-07T13:15:30)"`), cron and rate expressions, cron with offsets, and start and end times for when maintenance windows should run, and cutoff times to specify when to stop scheduling within a given time window.

Feature	State Manager	Maintenance Windows
Targeting	State Manager associations can target one or more nodes by using node ID, tag, or resource group. State Manager can target all managed nodes within a given account.	Maintenance windows can target one or more nodes using node IDs, tags, or resource groups.
Tasks within maintenance windows	Not applicable.	Maintenance windows can support one or more tasks where each task targets a specific Automation runbook or Command document action. All tasks within a maintenance window run in parallel unless different priorities are set for different tasks. Overall, maintenance windows support four task types: • AWS Systems Manager Run Command commands • AWS Systems Manager Automation workflows • AWS Lambda functions • AWS Step Functions tasks

Related information

The following related resources can help you as you work with this service.

Pricing

Some Systems Manager tools charge a fee. For more information, see AWS Systems Manager pricing.

Read blog posts about Systems Manager in the AWS Management Tools Category, and other posts tagged with #Systems Manager.

Service quotas

Review Systems Manager service quotas in the *Amazon Web Services General Reference*. Unless otherwise noted, each quota applies to a single Region in an AWS account.

Service Authorization Reference for Systems Manager

In the *AWS Service Authorization Reference*, view information about the actions, resources, and condition context keys you can use in AWS Identity and Access Management (IAM) policies for Systems Manager.

AWS Systems Manager Service Level Agreement

The AWS Systems Manager Service Level Agreement (SLA) is a policy governing the use of Systems Manager and applies separately to each AWS account using Systems Manager.

General AWS resources

The following general resources can help you as you work with AWS.

- Classes & Workshops – Links to role-based and specialty courses, in addition to self-paced labs to help sharpen your AWS skills and gain practical experience.
- AWS Developer Center – Explore tutorials, download tools, and learn about AWS developer events.
- AWS Developer Tools – Links to developer tools, SDKs, IDE toolkits, and command line tools for developing and managing AWS applications.
- Getting Started Resource Center – Learn how to set up your AWS account, join the AWS community, and launch your first application.
- Hands-On Tutorials – Follow step-by-step tutorials to launch your first application on AWS.
- AWS Whitepapers – Links to a comprehensive list of technical AWS whitepapers, covering topics such as architecture, security, and economics and authored by AWS Solutions Architects or other technical experts.
- AWS Support Center – The hub for creating and managing your AWS Support cases. Also includes links to other helpful resources, such as forums, technical FAQs, service health status, and AWS Trusted Advisor.
- Support – The primary webpage for information about Support, a one-on-one, fast-response support channel to help you build and run applications in the cloud.
- Contact Us – A central contact point for inquiries concerning AWS billing, account, events, abuse, and other issues.
- AWS Site Terms – Detailed information about our copyright and trademark; your account, license, and site access; and other topics.

Document history

The following table describes the important changes to the documentation since the last release of AWS Systems Manager. For notification about updates to this documentation, you can subscribe to an RSS feed.

Change	Description	Date
Updated managed policy AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` to add additional EC2 and SSM permissions for enhanced diagnosis capabilities. For information, see Systems Manager updates to AWS managed policies.	December 19, 2025
Updated managed policy AWSQuickSetupDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupDeploymentRolePolicy` to add support for two additional SSM documents: `AWSQuickSetupType-ConfigureDevOpsGuru` and `AWSQuickSetupType-DeployConformancePack`. These additions enable Quick Setup to deploy DevOps Guru configurations and conformance packs through the policy. For information, see Systems	December 15, 2025

	Manager updates to AWS managed policies.	
AWS Systems Manager Change Manager is no longer open to new customers.	AWS Systems Manager Change Manager is no longer open to new customers. Existing customers can continue to use the service as normal. For more information, see AWS Systems Manager Change Manager availability change.	November 7, 2025
New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available for all previousl y supported Regions and architectures. In addition, ARM64 and Mac with Apple silicon architecture support has been added for the Asia Pacific (New Zealand) Region (ap-southeast-6).	October 22, 2025
Updated Python and PowerShell runtime support	We've updated "Supporte d" lists and examples with the runtimes now officiall y supported by Systems Manager, which include Python 3.10, Python 3.11, and PowerShell 7.4 (dotnet8) . Previous versions are no longer supported.	October 16, 2025

Patch Manager support for IPv6 environments	Patch Manager now provides support for Internet Protocol version 6 (IPv6) environments. For information, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager and Patching a server in an IPv6 only environment.	October 15, 2025
AWS Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025.	AWS Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up prior to that date. Existing customers can continue to use the service as normal. For more information, see AWS Systems Manager Change Manager availability change.	October 7, 2025
New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available for all previousl y supported Regions and architectures. In addition, support has been added for the Asia Pacific (New Zealand) Region (ap-southeast-6), for the x86_64 and x86 architect ures only.	September 30, 2025

Updated managed policy AWSSystemsManagerJustInTimeAccessTokenPolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeAccessTokenPolicy` to provide data channel permissions for session management. For information, see Systems Manager updates to AWS managed policies.	September 25, 2025
Updated managed policy: AWSQuickSetupStartStopInstancesExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupStartStopInstancesExecutionPolicy` to refine permissions for Quick Setup scheduler configuration. The policy now provides more specific permissions for starting and stopping Amazon EC2 instances, accessing change calendars, and executing automation documents with enhanced security conditions. For information, see Systems Manager updates to AWS managed policies.	September 12, 2025

Updated managed policy: AWSQuickSetupStartSSMAssociationsExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupStartSSMAssociationsExecutionPolicy` to change the automation document from `AWSQuickSetupType-StartSSMAssociations` to `AWSQuickSetupType-Scheduler-ChangeCalendarState`. This update changes the policy's purpose from starting SSM associations to managing change calendar states for scheduled operations. For information, see Systems Manager updates to AWS managed policies.	September 12, 2025

Three updated managed policies	Systems Manager has updated three managed policies to enable Quick Setup to start Automation executions on additional Systems Manager resources: `AWSQuickSetupSSMLifecycleManagementExecutionPolicy`, `AWSQuickSetupPatchPolicyPermissionsBoundary`, and `AWSQuickSetupManagedInstanceProfileExecutionPolicy`. For information, see Systems Manager updates to AWS managed policies.	September 12, 2025
Updated managed policy: AmazonSSMAutomationRole	Systems Manager has updated the managed policy `AmazonSSMAutomationRole` to add the `ssmmessages:OpenDataChannel` permission. This permission allows Automation runbooks to establish communication channels for session-based operations. For information, see Systems Manager updates to AWS managed policies.	September 11, 2025

New topic: Understanding SSM Agent hibernation	This new topic explains that hibernation is an operational mode that occurs when the agent can't maintain proper communication with the Systems Manager service. During hibernation, the agent reduces its communication frequency and enters a standby state. For details about agent hibernation, see Understanding SSM Agent hibernation.	September 2, 2025
Updated managed policy: AWSSystemsManagerJustInTimeAccessServicePolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeAccessServicePolicy` to add automation execution tagging permissions, making it possible for customers to scope down operator permissions to specific tags. For information, see Systems Manager updates to AWS managed policies.	August 25, 2025

Updated descriptions for node detail tabs (unified console)	We've updated the descriptions of content on the tabs on the node details page in the unified console (Tabs: **Tags**, **Inventory**, **Association**, **Patches**, **Configuration compliance**). For information, see What is the unified console?.	August 20, 2025
New security best practice topic for installing SSM Agent	The new topic SSM Agent installation best practices explains the importance of using the correct method for installing the agent depending on the machine type, EC2 instance or hybrid-activated machine.	August 18, 2025

New console-based Automation features	AWS Systems Manager Automation has introduced enhanced execution capabilities with automatic retry for throttled operations and the ability to rerun automation executions. The automatic throttling retry feature helps ensure reliable automation execution at scale by automatically retrying API calls that encounter throttling limits, with configurable time limits up to 3600 seconds. (All Automation actions except aws:executeScript automatic throttling retry. Additionally, you can now easily rerun completed automation executions with identical or modified parameters, streamlining repeated tasks and reducing operational overhead without manually recreating configurations. For more information, see the following topics: • Configuring automatic retry for throttled operations • Rerunning automation executions • Running automations in multiple AWS Regions and accounts	August 14, 2025

Updates for the AWSQuickSetupDeploymentRolePolicy managed policy	Systems Manager has updated the `AWSQuickSetupDeploymentRolePolicy` managed policy to grant association-related permissions to additional `AWSQuickSetupType-*` Automation runbooks and to allow Quick Setup to attach and detach additional IAM policies. In addition, we have updated the documentation for `AWSQuickSetupDeploymentRolePolicy` to provide more detailed descriptions of the permissions granted for Quick Setup configuration management operations. For information, see Systems Manager updates to AWS managed policies.	August 12, 2025

New topic: Data perimeters in AWS Systems Manager	You can configure data perimeter policies for AWS service-owned resources that Systems Manager accesses. Data perimeters in AWS Systems Manager describes the purpose of the Systems Manager managed `ssm-document-categories-` *region* S3 bucket. This bucket contains metadata about document categories that help organize and classify SSM Documents in the console.	August 12, 2025
New managed policy for Quick Setup scheduler : AWSQuickSetupStartStopInstancesExecutionPolicy	Systems Manager has released a new managed policy, `AWSQuickSetupStartStopInstancesExecutionPolicy` , that provides permissions for Quick Setup to start and stop Amazon EC2 instances on a schedule. For information, see Systems Manager updates to AWS managed policies.	August 12, 2025

New AWS managed policy for Quick Setup: AWSQuickSetupStartSSMAssociationsExecutionPolicy	Systems Manager has released a new managed policy `AWSQuickSetupStartSSMAssociationsExecutionPolicy` that allows Quick Setup to run the `AWSQuickSetupType-StartSSMAssociations` Automation runbook. For information, see Systems Manager updates to AWS managed policies.	August 12, 2025
New troubleshooting guidance for zypper package lock dependency failures on SLES managed nodes	Added comprehensive troubleshooting guidance for resolving zypper package lock dependency failures that occur during Patch Manager `Install` operations on SUSE Linux Enterprise Server managed nodes. The new section Issue: Zypper package lock dependency failures on SLES managed nodes provides detailed information about identifying, diagnosing, and resolving package lock conflicts that prevent successful patch installation.	July 28, 2025

Enhanced troubleshooting guidance for skipped inventory associations	Updated the Skipped troubleshooting section to provide comprehensive guidance on inventory association priority handling. The enhanced documentation now includes detailed information about Quick Setup inventory associations, explicit targeting scenarios, and step-by-step resolution procedures for managing conflicting inventory associations. Key improvements include: • Explanation of inventory association priority order (Quick Setup, explicit, and global associations) • Common scenarios with specific examples and expected outcomes • Detailed resolution steps for removing Quick Setup configurations when using custom inventory associations • Important notes about data collection behavior and association precedence	July 24, 2025

Updated managed policy: AWS-SSM-RemediationAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-RemediationAutomation-ExecutionRolePolicy` to improve the security posture of the ssm:StartAutomationExecution API by requiring permissions for both "document" and "automation-execution" resource types. This update is being made to improve the security posture of the ssm:StartAutomationExecution API by requiring permissions for both "document" and "automation-execution" resource types, providing more comprehensive and detailed permissions for remediation automation execution. For information, see Systems Manager updates to AWS managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-RemediationAutomation-AdministrationRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-RemediationAutomation-AdministrationRolePolicy` to support API authorization improvements for remediation automation operations. The updated policy enhances permissions for executing activities defined within Automation documents, with improved security controls and resource access patterns for remediation workflows. For information, see Systems Manager updates to AWS managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` to provide more detailed and accurate permissions for diagnosis automation execution. The updated policy includes enhanced descriptions for Amazon EC2 and Amazon VPC resource access, more specific SSM automation permissions, and improved AWS KMS and IAM permission descriptions with proper resource restrictions. For information, see Systems Manager updates to AWS managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy` to include more specific permissions and security conditions for diagnosis automation operations. The updated policy provides enhanced security controls for AWS KMS key usage, Amazon S3 bucket access, and role assumptions, with stricter resource-based conditions and account-level restrictions. For information, see Systems Manager updates to AWS managed policies.	July 16, 2025
Added documentation for AmazonSSMAutomationRole managed policy	Systems Manager has updated the documentation for the existing managed policy `AmazonSSMAutomationRole` . For information, see Systems Manager updates to AWS managed policies.	July 15, 2025

Enhanced security for SSM documents with environment variable interpolation	AWS Systems Manager Command documents now support environment variable interpolation when processin g parameters. This feature, available in schema version 2.2 and with SSM Agent version 3.3.2746.0 or higher, helps prevent command injection attacks by treating parameter values as literal strings rather than potential ly executable commands. When set to `ENV_VAR`, the agent creates an environment variable named in the format `SSM_`*`parameter-name`* that contains the parameter's value. For more information, see the following topics: • Document components • Secure parameter handling examples • Data elements and parameters • Command document plugin reference	July 14, 2025

Explorer resource data sync available in four opt-in AWS Regions	By default, Explorer cross-account/cross-Region resource data syncs don't support data aggregation in opt-in Regions. Support was added for the following opt-in Regions on June 30, 2025. • Europe (Milan) • Africa (Cape Town) • Middle East (Bahrain) • Asia Pacific (Hong Kong) Note that you can't use a delegated administrator account to create a resource data sync in opt-in Regions. You must use an AWS Organizations management account. For more information, see Understanding multiple account and Region resource data syncs.	June 30, 2025
New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available for all supported Regions and architectures. In addition, support has been added for the Asia Pacific (Taipei) Region (ap-east-2).	June 26, 2025

New topic: Change Calendar integration with Amazon EventBridge	The topic Change Calendar integration with Amazon EventBridge provides information about this integration in the following categories: • Event timing and reliability • Event modifications and timing considerations • Adjacent and overlapping events • Best practices	June 25, 2025
Runtime support update for Automation action 'aws:executeScript'	The `Runtime` parameter in the Automation action aws:executeScript now supports PowerShell 7.4 (`dotnet8`) scripts.	June 24, 2025
SSM Agent and Patch Manager now support RHEL 10 and Ubuntu Server 25.04	You can now manage Red Hat Enterprise Linux 10 and Ubuntu Server 25.04 machines with Systems Manager, including patching managed nodes using Patch Manager. For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	June 23, 2025

Updates to just-in-time node access topics	We've made the following updates to content in the Just-in-time node access using Systems Manager chapter: • Clarified authentication support for just-in-time node access. For information, see Setting up just-in-time access with Systems Manager. • Clarified the requirement to tag the AWS KMS keys used for Session Manager encryption and RDP recording in just-in-time node access with the tag key `SystemsManagerJustInTimeNodeAccessManaged` and tag value `true`. For information, see Update just-in-time node access session preferences and Configuring S3 bucket encryption for RDP recordings. • Updated Configure notifications for just-in-time access requests with additional configuration details.	June 17, 2025

Enhanced RDP recording for just-in-time node access	AWS Systems Manager just-in-time node access now provides additional informati on about RDP recording configurations. When using AWS KMS encryption on S3 buckets where recordings are stored, you must provide access to the KMS key used for bucket encryption to the `ssm-guiconnect` service principal. This release also introduces a new recording status, `ProcessingError` , which indicates intermedi ate failures during video processing that could be due to service dependency failures or missing permissio ns.For more information, see Recording RDP connections.	June 13, 2025
Updated information about patch selection and installat ion in Patch Manager	Added information to explain how Patch Manager handles obsolete packages during patch selection and installat ion. For more information, see How security patches are selected and How patches are installed.	June 12, 2025

Updated managed policy for Quick Setup: AWSQuickSetupDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupDeploymentRolePolicy` so that Quick Setup can create associations using this managed policy instead of inline policies. For information, see Systems Manager updates to AWS managed policies.	June 10, 2025
Expanded introduction to Patch Manager	To better introduce Patch Manager to potential customers and users, we have added the following three sections to the Patch Manager chapter: • How can Patch Manager benefit my organization? • Who should use Patch Manager? • What are the main features of Patch Manager?	May 21, 2025

Updated managed policy for Quick Setup: AWSQuickSetupSSMDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupSSMDeploymentRolePolicy` to provide permissions to tag IAM roles and Lambda resources created for the unified console. For information, see Systems Manager updates to AWS managed policies.	May 7, 2025
Feature configuration options for the unified console	Systems Manager now provides feature configuration options when setting up the unified console. These feature configurations allow you to choose whether to set up Default Host Management Configuration (DHMC), inventory metadata collection, and automatic SSM Agent updates. For more information, see Setting up Systems Manager unified console for an organization and Setting up Systems Manager unified console for a single account and Region.	May 7, 2025

Updated managed policy for Quick Setup: AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy` to provide permissions to tag a resource shared by AWS Resource Access Manager for just-in-time node access. For information, see Systems Manager updates to AWS managed policies.	April 29, 2025
Updated managed policy for Quick Setup: AWSQuickSetupManageJITNAResourcesExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupManageJITNAResourcesExecutionPolicy` to provide permissions to tag IAM roles created for just-in-time node access. For information, see Systems Manager updates to AWS managed policies.	April 29, 2025

Systems Manager introduces just-in-time node access	AWS Systems Manager now supports a just-in-time access method of connecting to managed nodes. This new method of connecting to managed nodes helps improve the security of your nodes by providing temporary, time-bound access to nodes only when needed, eliminating the need for long-standing permissions. Additionally, Systems Manager provides session recording for RDP sessions to Windows Server nodes to help you meet compliance requirements, perform root cause analysis, and more. For more information, see Just-in-time node access using Systems Manager.	April 29, 2025
New managed policies for just-in-time node access	Systems Manager has released several new managed policies to support just-in-time node access. For information, see Systems Manager updates to AWS managed policies.	April 29, 2025
New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available for all supported Regions and architectures.	April 23, 2025

New topic: "What is compliance in Patch Manager?"	Patch compliance for the managed nodes in your fleet is not defined by AWS or other third parties. The new topic What is compliance in Patch Manager? clarifies that patch compliance for a node managed by Systems Manager means that all patches have been installed on the node that meet the approval criteria specified in the associated patch baseline. Compliance is defined by you, in the rules you configure in a patch baseline, or in a predefined patch baseline provided by AWS that you choose for your patching operations.	April 11, 2025
New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available. In addition, extension support has been added for the following Regions: • Asia Pacific (Thailand) (ap-southeast-7) • Mexico (Central) (mx-central-1)	April 3, 2025

New topic: Configuring permissions for Compliance	As a security best practice, we recommend that you update the AWS Identity and Access Management (IAM) role used by your managed nodes to restrict the node's ability to use the PutComplianceItems API action. This API action registers a compliance type and other compliance details on a designated resource, such as an Amazon EC2 instance or a managed node. For more information, see Configuring permissions for Compliance.	March 11, 2025
Updated topic: Reviewing node insights	In the unified console for Systems Manager, the **Review node insights** page reports the number of managed and unmanaged EC2 instances in your organization or account. We have clarified that Systems Manager includes an EC2 instance in the "Unmanaged" count when it is in a `Stopped` state. For more information, see What is an unmanaged instance?.	February 25, 2025

Updated topic: Verify the signature of SSM Agent	The AWS Systems Manager Agent (SSM Agent) RPM and Debian installer packages for Linux instances are cryptographically signed. You can use a public key to verify that the agent package is original and unmodified. If the files are damaged or have been altered, the verification fails. You can verify the signature of the installer package using either RPM or GPG. The topic includes a new public key for SSM Agent. For more information, see Verify the signature of SSM Agent.	February 14, 2025
New topic: Verify the signature of the Session Manager plugin	The Session Manager plugin RPM and Debian installer packages for Linux instances are cryptographically signed. You can use a public key to verify that the plugin binary and package is original and unmodified. If the file is altered or damaged, the verification fails. You can verify the signature of the installer package using the GNU Privacy Guard (GPG) tool. For more information, see Verify the signature of the Session Manager plugin.	February 13, 2025

Session Manager plugin updated	The Session Manager plugin was recently updated with the following enhancements: Upgraded the Go version to 1.23 in the Dockerfile. Updated the version configuration step in the README. For more information about the Session Manager plugin, see Install the Session Manager plugin for the AWS CLI.	February 6, 2025
TPS quotas published for Automation API actions	We have published the transaction per second (TPS) quotas, formerly known as limited, for several Systems Manager Automation-related API actions. For information, see Systems Manager service quotas in the *Amazon Web Services General Reference*.	January 21, 2025
Terminology change: Systems Manager capabilities renamed as "tools"	Until now, the functional units that make up Systems Manager have been called *capabilities*, such as the Automation capability, the Parameter Store capability, and so on. These functional units are now referred to as *tools*, such as the Automation tool and the Parameter Store tool. This user guide has been updated to reflect the change.	January 10, 2025

Patch Manager support for additional macOS versions (Amazon EC2 AMIs)	Patch Manager now supports macOS versions 12.7, 13.6 and 13.7, and 15.*x*. For complete lists of OSs and versions supported by Patch Manager, see Supported operating systems for Patch Manager.	January 8, 2025
SSM Agent and Patch Manager support for additional versions: CentOS Stream, Ubuntu Server, and Windows Server	Patch Manager now supports CentOS Stream 9, Ubuntu Server 24.10, and Windows Server 2025. SSM Agent now supports Ubuntu Server 24.10 and Windows Server 2025. (Agent support for CentOS Stream 9 was previousl y released.) For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	November 22, 2024

New topic: AWS KMS encryption for Parameter Store SecureString parameters	Learn how AWS Systems Manager Parameter Store uses AWS Key Management Service to encrypt the values of `SecureString` parameters in Parameter Store in the following topic: • AWS KMS encryption for SecureString parameters in Parameter Store	November 22, 2024
New and updated managed policies for Systems Manager	To support new features for Systems Manager, we are releasing multiple new managed policies to support new Systems Manager configurations and operations, and updating other managed policies. For more information, see Systems Manager updates to AWS managed policies.	November 21, 2024

A new, simplified node management experience for Systems Manager	AWS Systems Manager has released a new unified console experience for managing nodes at scale across accounts and Regions. You can now see all managed and unmanaged nodes across your organizations' AWS accounts and Regions from a single place. You can also identify, diagnose, and remediate unmanaged nodes. Systems Manager is also now integrated with Amazon Q Developer (Amazon Q), which extends your ability to see and control your nodes from anywhere in the AWS Management Console by entering natural language prompts. With this release, you can also now use AWS Organizations to allow a delegated administrator account to manage nodes across the organization from a central viewpoint. For more information, see the following topics: • What is AWS Systems Manager? • Setting up AWS Systems Manager • Complete node tasks with AWS Systems Manager	November 21, 2024

Session Manager plugin bug fix	The Session Manager plugin was recently updated with the following bug fix: Rolled back change that added credentials to OpenDataC hannel requests.	November 20, 2024
Session Manager plugin enhancements	**This version was deprecated on 11/20/2024.** The Session Manager plugin was recently updated with the following enhancements. • Added credentials to OpenDataChannel requests. • Upgraded the `testify` and `objx` dependent packages.	November 6, 2024
Additional OS version support for macOS	Systems Manager now supports version 15.*x* (Sequoia) of the macOS operating system (EC2 instances only). For a list of all supported OSs and versions, see Supported operating systems for Systems Manager.	November 6, 2024

Patch Manager: Updates to supportd package name formats for Approved and Rejected lists	For several operating systems, we have updated and expanded the lists of formats for package names that you can specify in **Approved patches** and **Rejected patches** lists in your patch baselines. For information, see Package name formats for Amazon Linux 1, Amazon Linux 2, Amazon Linux 2022, Amazon Linux 2023, CentOS, Oracle Linux, and Red Hat Enterprise Linux (RHEL).	November 1, 2024
Additional operating version support for Patch Manager	Patch Manager now supports additional versions of Oracle Linux (8.10 and 9.4) and Ubuntu Server (23.10 and 24.04). For lists of all supported operating systems and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	November 1, 2024

SSM Agent support for additional versions: CentOS Stream, Oracle Linux, and Ubuntu Server	SSM Agent now supports CentOS Stream 9, Oracle Linux 8.10 and 9.4, and Ubuntu Server 24.04 LTS, in addition to earlier supported versions. For complete lists of supported OSs and versions for Systems Manager, see Supported operating systems for Systems Manager.	October 25, 2024
Session Manager plugin enhancement	Added support for passing the plugin version with OpenDataChannel requests.	October 10, 2024
New: View details about RDP connections made using Fleet Manager	You can now view informati on about Remote Desktop Protocol connections that have been made by users in your AWS account. For information, see Viewing information about current and completed connections.	October 10, 2024
Patch Manager now supports SLES version 15.6	Patching support for SUSE Linux Enterprise Server (SLES) 15.6 has been released. You can now patch SLES 15.6 machines using Patch Manager. For a full list of operating systems and versions supportd by Patch Manager, see Supported operating systems for Patch Manager.	September 29, 2024

New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available. Support for all architectures has been introduced for the Asia Pacific (Malaysia) Region (ap-southeast-5). In addition, ARM64 and Mac with Apple silicon architecture extension support has been added for the following Regions: • Asia Pacific (Hyderabad) (ap-south-2) • Asia Pacific (Melbourne) (ap-southeast-4) • Canada West (Calgary) (ca-west-1) • Europe (Zurich) (eu-central-2) • Europe (Spain) (eu-south-2) • Middle East (UAE) (me-central-) • China (Beijing) (cn-north-1) • China (Ningxia) (cn-northwest-1) • Israel (Tel Aviv) (il-central-1) • AWS GovCloud (US-East) (us-gov-east-1) • AWS GovCloud (US-West) (us-gov-west-1)	September 19, 2024

New topic: Configuring permissions for maintenance windows using the AWS CLI	The topic Configuring permissions for maintenance windows using the AWS CLI provides instructions for creating a custom service role (and its policies) for running maintenance window tasks on a user's behalf.	August 19, 2024
SSM Agent and Patch Manager support for additional versions: AlmaLinux, Oracle Linux, and Rocky Linux	SSM Agent and Patch Manager now support versions 8.10, 9.3, and 9.4 of AlmaLinux and Rocky Linux, and version 9.3 of Oracle Linux, in addition to earlier supported versions. For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	August 14, 2024

New IAM policy condition for Parameter Store support: ssm:Policies	Using `ssm:Policies` , a newly supported condition for IAM policies, you can prevent Entities from creating or updating parameter that include a parameter policy. For more information, see the following topics: • ssm:Policies: Prevent creation or updates to parameters that use parameter policies • Condition keys for AWS Systems Manager in the *Service Authorization Reference*.	August 14, 2024
Updated managed policy for Quick Setup: SSMQuickSetupRolePolicy	Systems Manager has updated the managed policy `SSMQuickSetupRolePolicy` to provide access to additional CloudFormation stack sets. For information, see Systems Manager updates to AWS managed policies.	August 13, 2024

Support for provisioning and managing Systems Manager resources using Terraform	We have added HashiCorp Terraform to the list of supported third-party integrations with Systems Manager. Terraform is an open-source *infrastructure as code* (IaC) software tool that provides a command line interface (CLI) workflow to manage various cloud services. You can use Terraform to provision and manage a number of commonly used Systems Manager resources and data sources. For information about this and other third-par ty integrations with Systems Manager, see Integration with other products and services.	August 1, 2024

New Quick Setup console experience and API	Systems Manager Quick Setup has released a new console experience and API. Now you can interact with this API using the console, AWS CLI, CloudFormation, and SDKs. You can opt in to the new console using the Quick Setup console. For more information about onboarding to the new Quick Setup experience, see Getting started with Quick Setup. For more details about the API operations available through the Quick Setup API, see the Quick Setup API Reference.	August 1, 2024

New topic: Rejected patch list options in custom patch baselines	For patching operations that use a custom patch baseline in Patch Manager, we have clarified the behavior when a patch added to the **Rejected patch** list is assigned the action `Allow as dependency` . Because Windows Server doesn't support the concept of patch dependencies, patches not already installed on a managed node are skipped. Patches that are already installed on the node are assigned the status `INSTALLED_REJECTED` . For more information, see Rejected patch list options in custom patch baselines and Patch compliance values for other operating systems.	July 23, 2024
New topic: Configuring SSM Agent for use with the Federal Information Processing Standard (FIPS)	We have provided instructions for configuring SSM Agent for use with the Federal Information Processing Standard (FIPS). For information, see Configuring SSM Agent for use with the Federal Information Processing Standard (FIPS).	July 22, 2024

Update: Clarified support for @ symbol in Fleet Manager user names	If an IAM Identity Center user name contains one or more @ symbols, Fleet Manager RDP disregards the first @ symbol and all characters that follow it, whether or not the @ introduces the domain portion of an email address. For more informati on about supported character s for user names in Fleet Manager RDP connections, see Authenticating Remote Desktop connections.	July 21, 2024
Updated managed policy: AmazonSSMManagedEC 2InstanceDefaultPolicy	Systems Manager has updated the managed policy `AmazonSSMManagedEC 2InstanceDefaultPo licy` by providing inline statement IDs (Sids) to clarify the purpose of each policy statment. For information, see Systems Manager updates to AWS managed policies.	July 18, 2024

Name changes to AWS managed buckets for Patch Manager patching operations	AWS owns and maintains a number of Amazon S3 buckets that SSM Agent accesses in the course of performing various Patch Manager patching operations. These S3 buckets are publicly accessible, and by default, SSM Agent connects to them using HTTP calls. However, if you're using a virtual private cloud (VPC) endpoint in your Systems Manager operation s, you must provide explicit permission in an Amazon EC2 instance profile for Systems Manager, or in a service role for non-EC2 machines in a hybrid and multiclou d environment. Otherwise, your resources can't access these public buckets. In most cases, we are changing the names of these buckets. For example, for patching operations, the bucket `aws-patchmanager-macos-us-east-2` is replaced by `aws-patchmanager-macos-us-east-2-552881074` , and the bucket `aws-ssm-us-east-2` is replaced by `aws-patch-manager-us-east-2-552881074` . For more	July 18, 2024

	information, see the following topics: • SSM Agent communications with AWS managed S3 buckets • Reference: Amazon S3 buckets for patching operations	
New service-linked role for Quick Setup	Systems Manager has released a new service-linked role, `AWSServiceRoleForSSMQuickSetup` . Systems Manager uses this role to check configuration health of resources set up using Quick Setup, to ensure consistent use of parameters and provisioned resources, and to remediate resources when drift is detected. The managed policy associated with this role is `SSMQuickSetupRolePolicy` . For more information, see AWSServiceRoleForSSMQuickSetup service-linked role permissions for Systems Manager.	July 3, 2024

New managed policies for Quick Setup configuration types	Systems Manager has released an additional 12 new managed policies to support various Quick Setup configuration types and processes. For information, see Systems Manager updates to AWS managed policies.	July 3, 2024
Support for RHEL 8.10 and 9.4	Systems Manager and Patch Manager now support Red Hat Enterprise Linux versions 8.10 and 9.4. For more information, see Supported operating systems and machine types and Supported operating systems for Patch Manager.	June 26, 2024
Patch Manager support for 8.8 and 8.9 versions: AlmaLinux, Oracle Linux, and Rocky Linux	Patch Manager now supports versions 8.8 and 8.9 of AlmaLinux, Oracle Linux, and Rocky Linux, in addition to earlier 8.x versions. For complete lists of supported OSs and versions for Patch Manager, see Supported operating systems for Patch Manager.	June 17, 2024

New public parameters for macOS Amazon EC2 AMIs	Public parameters have been released to support Amazon Machine Images for macOS Amazon Elastic Compute Cloud instances. For more information, see the following topics. • Finding public parameters • Calling AMI public parameters for macOS • Launch a Mac instance in the *Amazon EC2 User Guide* • Amazon EC2 Mac instances in the *Amazon EC2 User Guide* • Use AWS Systems Manager parameters instead of AMI IDs in launch templates in the *Amazon EC2 Auto Scaling User Guide*	June 17, 2024
Update: Regional availability of the `/aws/service/global-infrastructure` parameter path	We have clarified which commercial Regions the `/aws/service/global-infrastructure` public parameter path can be queried from, and how to run a query for the path if you are working in a different commerical AWS Region. For information, see Calling public parameters for AWS services, Regions, endpoints, Availability Zones, local zones, and Wavelength Zones.	June 12, 2024

New: Code examples chapter	A new chapter, Code examples for Systems Manager using AWS SDKs, provides examples in different SDK languages for how to work with the Systems Manager service.	May 8, 2024
Changes to `ec2messages:*` endpoint support	For AWS Regions launching in 2024 or later, the `ec2messages:*` endpoints are not supported by SSM Agent for sending status and execution information back to the Systems Manager service. Accounts in these Regions must use `ssmmessages:*`. In Regions launched before 2024, both `ssmmessages:*` and `ec2messages:*` are still supported, but we recommend using only the `ssmmessages:*` endpoint (Amazon Message Gateway Service) now. You can safely remove `ec2messages:*` permissions from your policies at this time. For more information, see Working with SSM Agent and Agent-related API operations (ssmmessages and ec2messages endpoints).	May 3, 2024

Additional runtimes available for running scripts in Automation runbooks	The `aws:executeScript` action now supports the Python 3.9, 3.10, and 3.11 runtimes. For more information about how to use this action, see `aws:executeScript`.	April 23, 2024
Support for 8.8 and 8.9 versions: AlmaLinux, Oracle Linux, and Rocky Linux	Systems Manager now supports versions 8.8 and 8.9 of AlmaLinux, Oracle Linux, and Rocky Linux, in addition to earlier 8.x versions. For complete lists of supported OSs and versions, see Supported operating systems for Systems Manager.	April 22, 2024

Patch Manager: Change to patching status 'INSTALLED_PENDING_REBOOT'	Previously, only patches installed by Patch Manager could be marked as `INSTALLED_PENDING_REBOOT` . Patches installed outside of Patch Manager were never given this status. Now, `INSTALLED_PENDING_REBOOT` can apply to any patch that has been applied to a managed node since it was last rebooted. This includes patches installed by Patch Manager with the `NoReboot` option selected, and to patches installed outside of Patch Manager after the node's most recent reboot. For descriptions of all Patch Manager patching status values, see Understanding patch compliance state values.	April 16, 2024
Support for RHEL 8.9 and 9.3	Systems Manager, including Patch Manager, now supports Red Hat Enterprise Linux (RHEL) versions 8.9 and 9.3, in addition to earlier 8.x and 9.x versions.	March 26, 2024

Topic update: AWS managed policies for AWS Systems Manager	The topic AWS managed policies for AWS Systems Manager has provided information about the four managed policies for Systems Manager that have been introduced or updated since March 12, 2021. We have added a section to this topic with information about the 12 other managed policies for use with Systems Manager that were created or last updated before that date. For details, see Additional managed policies for Systems Manager.	March 1, 2024

Parameter Store now supports cross-account sharing	You can now share advanced parameters securely and efficiently across AWS accounts or within your AWS Organization by setting up resource sharing. Resource sharing allows you to centralize application configuration management and reduce the operational overhead of sharing the parameters with every single account you own. Parameters can be shared across accounts using the Parameter Store console, the AWS RAM console, or the AWS CLI. For more information, see Working with shared parameters.	February 21, 2024
Automation action enhancement	You can now use the `onFailure` and `isCritical` properties with the `aws:approve` action. For more information about the `aws:approve` action, see aws:approve – Pause an automation for manual approval.	February 12, 2024

Additional operating version support for Patch Manager	We have added to the list of supported operating system versions for Patch Manager. Support has been added for the following: • Debian Server 11.x and 12.x • macOS 14.x (Sonoma) • SUSE Linux Enterprise Server (SLES) 15.5 • Ubuntu Server 23.04	January 4, 2024
Configure automated SSM Agent updates using the Application Manager console	You can now use the Applicati on Manager console to automate SSM Agent updates for your application instances . For more information, see Working with your application instances.	December 21, 2023
Updated process for registeri ng non Amazon EC2 machines in hybrid and multicloud environments	Systems Manager now provides the `ssm-setup-cli` to help you register non Amazon Elastic Compute Cloud (Amazon EC2) machines in hybrid and multicloud environments. For more information, see How to install the SSM Agent on hybrid Linux nodes and How to install the SSM Agent on hybrid Windows nodes.	December 20, 2023

Manage Amazon EBS volumes using Fleet Manager	You can now use Fleet Manager, a tool in AWS Systems Manager, to manage Amazon Elastic Block Store volumes on your managed instances. For example, you can initialize an EBS volume, format a partition, and mount the volume to make it available for use. For more information, see EBS volume management.	December 14, 2023
Session Manager plugin enhancement	Added support for passing a StartSession API response as an environment variable to session-manager-plugin.	December 4, 2023
New visual design experience for Automation runbooks	You can now create and edit runbooks using a new visual design experienc e developed by Systems Manager Automation. The visual design experience provides a low-code, drag-and-drop interface so you can create and edit runbooks more easily. For more information, see Visual design experience for Automation runbooks.	November 26, 2023

New Systems Manager Automation actions, data element, and functional enhancements for runbooks	You can now loop over multiple actions in a runbook using the `aws:loop` action. This new action supports `do while` and `for each` style loops. Additionally, using the new *variables* data element, you can define, reference and update values dynamically within the context of a runbook. To update the value of a variable in your runbook, use the new `aws:updateVariable` action. Automation has also added support for dynamic data type conversions for outputs. This means that if the value of an output doesn't match the data type you've specified, Automation tries to convert the data type. For example, if the value returned is an `Integer`, but the `Type` specified is `String`, the final output value is a `String` value. Lastly, Automation now supports JSONPath filter expressions for selectors. For more information, see the following topics: • aws:loop – Iterate over steps in an automation	November 17, 2023

	• aws:updateVariable – Updates a value for a runbook variable • Data elements and parameters – Top-level data elements • Using action outputs as inputs. • Using JSONPath in runbooks.	
Updated Region support for Remote Desktop Protocol (RDP) connections	Fleet Manager Remote Desktop, which is powered by Amazon DCV, provides you with secure connectivity to your Windows Server instances directly from the Systems Manager console. The following three additional Regions have been enabled for Fleet Manager Remote Desktop connections: • Africa (Cape Town) (af-south-1) • Asia Pacific (Jakarta) (ap-southeast-3) • Israel (Tel Aviv) (il-central-1)	November 15, 2023

Patch Manager: Expanded OS version support for RHEL and macOS	Patch Manager now supports the following additional operating system versions: • Red Hat Enterprise Linux: version 8.8 • macOS: 11.5–11:7 (Big Sur) • macOS: 12.0–12.6 (Monterey) • macOS: 13.0–13.5 (Ventura)	October 23, 2023
New OpsCenter API - DeleteOpsItem	OpsCenter now offers the DeleteOpsItem API for deleting individual OpsItems. For more information, see DeleteOpsItem in the *AWS Systems Manager API Reference*.	October 20, 2023
New Quick Setup configuration type: SSM Agent updates for entire organization	The new configuration type **Default Host Management Configuration** makes it possible for an organization administrator, as defined in AWS Organizations, to prompt automatic check and updates of SSM Agent on *all* EC2 instances in the organization's accounts and Regions. For more information, see Default Host Management for an organization.	October 16, 2023

New title and description format for OpsItems created by CloudWatch Application Insights	The title and description for OpsItems created by CloudWatch Application Insights is changing to an improved format on October 16, 2023. To view the new format, see Amazon CloudWatch Application Insights.	September 29, 2023
Support for multiple display resolutions in Fleet Manager RDP connections	When you connect to Windows Server managed nodes using the Remote Desktop protocol (RDP) option in Fleet Manager, you can now choose the display resolution. Previously, all connections used a fixed 720P (1366 x 768) resolution. You can now choose from the following for each connectio n: • **Adapt Automatically** (determines optimum resolution based on your detected screen size) • **1920 x 1080** • **1400 x 900** • **1366 x 768** • **800 x 600** For information, see Connect to a managed node using Remote Desktop.	September 22, 2023

New topic: Random patch baseline IDs in patch policy operations	We have added content to describe how Quick Setup patch policies use the `BaselineOverride` parameter in the `AWS-RunPatchBaseline` SSM Command document to generate random IDs for patch baselines each time a patch policy operation is run. For information, see Random patch baseline IDs in patch policy operations.	September 22, 2023
A new operational insight for managing OpsItems	OpsCenter now includes an operational insight called **Resources generating the most OpsItems**. An insight of this type is generated when an AWS resource has more than 10 open OpsItems. Use this insight to locate problematic resources. Use the `AWS-BulkResolveOpsItems` runbook from within an insight to quickly resolve OpsItems associated with a resource. For more informati on, see Analyzing operational insights to reduce OpsItems.	September 22, 2023
GPG public key updated	A new public key has been created to verify the signature of SSM Agent. For more information, see Verifying the signature of SSM Agent.	September 5, 2023

Support added for additional versions of AlmaLinux, Oracle Linux, RHEL, and Rocky Linux	The lists of supported operating systems for AWS Systems Manager and Patch Manager have been updated to reflect support the following additional OS versions: • AlmaLinux: 9.2 • Oracle Linux: 8.7 and 9.2 • Red Hat Enterprise Linux (RHEL): 8.7, 9.1, and 9.2 • Rocky Linux: 8.6 and 8.7, 9.0–9.2	August 30, 2023
OpsCenter added support for Markdown formatting in the OpsItem description field.	OpsCenter now supports Markdown formatting in the OpsItem description field. The following types of Markdown formatting are supported: • Paragraphs • Line spacing • Horizontal Lines • Headings • Text Formatting • Links • Lists For more information, see Using Markdown in the Console in the *Getting Started with the AWS Management Console Getting Started Guide.*	August 18, 2023

New versions of the AWS Parameters and Secrets Lambda Extension	New versions of the AWS Parameters and Secrets Lambda Extension are now available. In addition, extension support has been added for the Asia Pacific (Melbourne) (ap-southeast-4) and Israel (Tel Aviv) (il-centr al-1) Regions (x86_64 and x86 architectures only.) For more information, see Using Parameter Store parameters in AWS Lambda functions.	August 16, 2023

Update: Added information about required permissions for Quick Setup patch policy buckets	When you create a patch policy, Quick Setup creates an Amazon S3 bucket that contains a file named `baseline_overrides.json` . This file stores information about the patch baselines that you specified for your patch policy. When configuring the patch policy, you have the option of selecting an **Add required IAM policies to existing instance profiles attached to your instances** check box. If you choose not to select this option, then you must manually provide certain resources with permissions to access this bucket or your policy operations might fail. For more information, see the following topics: • Permissions for the patch policy S3 bucket • Issue: "Invoke-PatchBaselineOperation : Access Denied" error or "Unable to download file from S3" error for `baseline_overrides.json`	July 6, 2023

Use Quick Setup to configure OpsCenter for multi-account OpsItem management	Quick Setup for OpsCenter helps you complete the following tasks for managing OpsItems across accounts: • Specifying the delegated administrator account • Creating required AWS Identity and Access Management (IAM) policies and roles • Specifying an AWS Organizations organizat ion, or a subset of member accounts, where a delegated administrator can manage OpsItems across accounts For more information, see (Optional) Configure OpsCenter to manage OpsItems across accounts by using Quick Setup.	June 19, 2023
Update Amazon EC2 launch agents using Quick Setup	You can now allow Systems Manager to check every 30 days for a new version of the launch agent installed on your instance. If a new version is available, Systems Manager updates the agent on your instance. For more informati on, see Quick Setup Host Management.	June 19, 2023

Patch Manager now supports Ubuntu Server 22.04 LTS	You can now use Patch Manager to patch Ubuntu Server 22.04 LTS nodes. Like other supported versions of Ubuntu Server, version 22.04 LTS, uses the AWS managed `AWS-UbuntuDefaultPatchBaseline` patch baseline.	May 15, 2023
Systems Manager now supports AlmaLinux, including Patch Manager	You can now use Systems Manager to manage AlmaLinux 8.3-8.7; 9.0-9.1 nodes. Many of the rules that apply to RHEL 8 for patching also apply to AlmaLinux . AlmaLinux uses the new `AWS-DefaultAlmaLinuxPatchBaseline` . For more information, see the following topics: • Manually install SSM Agent on AlmaLinux instances • How security patches are selected • How patches are installed • How patch baseline rules work on AlmaLinux, RHEL, and Rocky Linux.	May 8, 2023

Deploy the EC2Launch v2 agent using Quick Setup	You can now deploy the EC2Launch v2 agent using Quick Setup. For more information, see Deploy Distributor packages with Quick Setup.	April 13, 2023
Systems Manager now supports Amazon Linux 2023	Systems Manager now supports the new Amazon Linux 2023 (AL2023) EC2 instance type, including support for Patch Manager operations. Many of the rules for patching that apply to Amazon Linux 2 also apply to Amazon Linux 2023. (Patch Manager also continues to support the preview release Amazon Linux 2022.) For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Amazon Linux 1, Amazon Linux 2, Amazon Linux 2022, and Amazon Linux 2023	March 23, 2023

Revised setting up content for Amazon EC2 instances	We have revised the setting up content for Amazon EC2 instances. It is now recommended to use the newly released Default Host Management Configuration for instance permissions. For more information, see Configure instance permissions required for Systems Manager.	February 15, 2023
Automatic instance management with the Default Host Management Configuration	You can now automatically manage Amazon EC2 instances in an entire AWS Region using Systems Manager. For more information, see Default Host Management Configuration.	February 15, 2023
Add SSM documents to your favorites	To help you find frequently used SSM documents, you can now add documents to your favorites. You can favorite up to 20 documents per document type, per AWS account and AWS Region. You can choose, modify, and view your favorites from the Systems Manager **Documents** console. For more information, see Adding documents to your favorites.	February 7, 2023

Implement change controls for Automation using Change Calendar	By integrating Automation with Change Calendar, you can now implement change controls to all automatio ns in your AWS account. For more information, see Implement change controls for Automation.	January 24, 2023
New Change Manager approval workflow	The Change Manager approval workflow now supports *per-level* approvals instead of *per-line approvals* . Previously, every approver you added to an approval level had to approve a change request. Otherwise, the level was not approved. Now, you specify how many approvals are required for the level and can add that many or more approvers. For example, you can require three approvals for a level but specify up to five approvers. Approvals from any three of those approvers are sufficien t to approve the level. For more information, see About approvals in your change templates.	January 23, 2023

New: Configure patching for an entire organization using a patch policy in Quick Setup	With Quick Setup, a tool in Systems Manager, you can now create *patch policies* powered by Patch Manager. A patch policy defines the schedule and patch baseline to use when automatically patching your managed nodes. Using a single patch policy configuration, you can define patching for all accounts in all Regions in your organization, for only the accounts and Regions you choose, or for a single account-Region pair. For more information, see the following topics. • Using Quick Setup patch policies • Automate organization-wide patching using a Quick Setup patch policy	December 22, 2022

Application Manager integrates with Amazon EC2 to display information about your instances in the context of an application.	Application Manager displays instance state, status, and Amazon EC2 Auto Scaling health for a selected application in a graphical format. The **Instances** tab also includes a table with the following information for each instance in your application.
	• Instance state (Pending, Stopping, Running, Stopped)
	• Ping status for SSM Agent
	• Status and name of the last Systems Manager Automation runbook processed on the instance
	• A count of Amazon CloudWatch Logs alarms per state.
	  • `ALARM` – The metric or expression is outside of the defined threshold.
	  • `OK` – The metric or expression is within the defined threshold.
	  • `INSUFFICIENT_DATA` – The alarm has just started, the metric is not available, or not enough data is available for the metric to determine the alarm state.
		December 22, 2022

	• Auto Scaling group health for the parent and individua l autoscaling groups	
Schedule the starting and stopping of your Amazon EC2 instances using Quick Setup	You can now deploy the Resource Scheduler solution to automate the starting and stopping of your Amazon EC2 instances using Quick Setup. For more information, see Resource Scheduler.	December 19, 2022

OpsCenter now supports working with OpsItems across accounts	OpsCenter supports working with OpsItems from a management account (either an AWS Organizations management account or a Systems Manager delegated administrator account) and a member account during a session. Once configure d, users can perform the following types of actions: • Create, view, and update OpsItems in a member account • View detailed informati on about AWS resources specified in OpsItems in a member account • Start Systems Manager Automation runbooks to remediate issues with AWS resources in a member account For more information, see Setting up OpsCenter to work with OpsItems across accounts.	November 16, 2022

Track details of Change Manager change requests using AWS CloudTrail Lake	You can now use an event data store in AWS CloudTrail Lake to capture and review details about the change requests that are run in Change Manager for your organization or account. This information includes auditable details about the user identity that created the change request, the IP address from which the request was made, the AWS Regions in which the changes were made, the targeted resources, and more. For information, see Monitoring your change request events and Reviewing change request details, tasks, and timelines.	November 11, 2022

Additional Systems Manager Automation task controls using CloudWatch alarms	You can now implement additional control when running automations across multiple accounts and Regions by using CloudWatch alarms. By applying a metric or composite CloudWatc h alarm to an automation, you can control when an automation stops based on the metrics you define. For more information about applying a CloudWatch alarm to an automation running across multiple accounts and Regions see Run an automatio n in multiple Regions and accounts (console)	November 9, 2022
Updated: 'Using Parameter Store parameters in AWS Lambda functions'	We have provided additiona l information to help you use the AWS Parameters and Secrets Lambda Extension to retrieve parameter values and cache them for future use in Lambda functions. Using the Lambda extension can reduce your costs by reducing the number of API calls to Parameter Store. For information, see Using Parameter Store parameters in AWS Lambda functions.	October 25, 2022

Additional Systems Manager task controls using CloudWatch alarms	You can now implement additional control when running automations and commands by using CloudWatch alarms. A CloudWatch alarm can also be added to an automation or command when it is registered with a State Manager association or maintenance window task. By applying a composite CloudWatch alarm to an automation or command, you can control when an automation or command stops based on the metric you define. For more information about applying a CloudWatch alarm to an automation or command see the following procedures: • How security patches are selected • How patches are installed • How patch baseline rules work on Amazon Linux 1, Amazon Linux 2, and Amazon Linux 2022.	September 26, 2022

Additional Systems Manager task controls using CloudWatch alarms	You can now implement additional control when running automations and commands by using CloudWatch alarms. A CloudWatch alarm can also be added to an automation or command when it is registered with a State Manager association or maintenance window task. By applying a composite CloudWatch alarm to an automation or command, you can control when an automation or command stops based on the metric you define. For more information about applying a CloudWatch alarm to an automation or command see the following procedures: • Running a simple automation • Running commands from the console • Create an association • Assign tasks to a maintenance window	September 26, 2022
Clarifying advanced-instances tier requirements	Based on customer feedback, we have clarified the scenarios that require you to activate the advanced-instances tier in Configuring instance tiers.	September 21, 2022

Deploy the Amazon CloudWatch Agent using Quick Setup	You can now deploy the Amazon CloudWatch agent using Quick Setup. For more information, see Deploy Distributor packages with Quick Setup.	September 20, 2022
'PatchGroup' key now supported for patch groups when EC2 instance metadata is allowed	When you allow tags in EC2 instance metadata, the tag keys you create must not contain any spaces. Previously, this prevented customers from adding some of their EC2 instances to patch groups in Patch Manager because the tag key `Patch Group` had to be applied to the instances. Patch Manager now supports both `Patch Group` (with a space) and `PatchGroup` (without a space) as the tag key for identifying instances for a patch group. EC2 instances where tags are allowed in instance metadata can now be added to patch groups in Patch Manager. For information, see About patch groups.	August 31, 2022

New topic: "How package release dates and update dates are calculated"	In patch baselines managed by AWS, new patches are auto-approved 7 days after they are released or updated. In custom patch baselines you create, you can optionall y specify how many days to wait after they are released or updated to auto-approve their installation. For Amazon Linux 1 and Amazon Linux 2, various factors influence how the latest release dates and update dates are calculated. To help you avoid unexpecte d results when choosing auto-approval delays, these factors are explained in the topic How package release dates and update dates are calculated.	August 24, 2022
Updated content: Patch an AMI and update an Auto Scaling group	We have updated the Updating AMIs for Auto Scaling groups walkthrou gh to use launch templates instead of launch configura tions. Additionally, we've implemented the latest Automation actions and runtimes in the runbook content.	June 22, 2022

Change Manager: Prevent users from creating auto-approvable requests	You can configure change templates in Change Manager to support automatic approvals, meaning that users with the necessary IAM permissions can choose to start the change request without requiring additional approval. Now, you can also restrict individual users, groups, or IAM roles from submitting auto-approval requests, even if a change template supports them. This is achieved through the use of a new IAM condition key, `ssm:AutoApprove` . For more information, see Controlling access to auto-approval runbook workflows	June 15, 2022

Updated guidance for maintenance window task roles	Previously, the Systems Manager console provided you with the ability to choose the AWS managed IAM service-linked role `AWSServiceRoleForAmazonSSM` to use as the maintenance role for your tasks. Using this role and its associated policy, `AmazonSSMServiceRolePolicy`, for maintenance window tasks is no longer recommended. You should create a custom policy and role for maintenance window tasks instead. For more information, see Setting up Maintenance Windows.	June 9, 2022
Port forwarding to remote hosts support for Session Manager	Session Manager now supports port forwarding sessions to remote hosts. The remote host isn't required to be managed by Systems Manager. For more information, see Starting a session (port forwarding to remote host).	May 25, 2022

Updated content: Instructions for manually installing SSM Agent on Amazon EC2 Linux instances	In response to customer feedback, we have overhauled the topics that provide instructions for manually installing SSM Agent on Amazon EC2 instances. These topics now provide commands using globally available files that you can copy and paste for quick installation on EC2 instances in any AWS Region. These topics also provide information to help you creating installation commands that use files available in your own working Region. The latter approach is recommended when you are installing the agent on multiple instances using a script or template. For more information, see the instructions for your Linux operating system in the section Manually installing SSM Agent on EC2 instances for Linux.	May 9, 2022

New topic: Amazon Machine Images (AMIs) with SSM Agent preinstalled	In response to customer feedback, we have centralized information about which AWS managed AMIs include SSM Agent preinstalled. This topic also provides instructions for how to verify that an Amazon EC2 instance created from these AMIs was successfully installed and is running. For rare cases where the agent might not install successfully, or install but not start, we also provide information about starting or manually installing the agent on these instances. For details, see Amazon Machine Images (AMIs) with SSM Agent preinstalled.	May 8, 2022
New State Manager section	Added a new section that describes the details of when State Manager runs associations. For more information, see About association scheduling.	April 27, 2022

Patch Manager now supports Rocky Linux	You can now use Patch Manager to patch Rocky Linux nodes. Many of the rules that apply to RHEL 8 for patching also apply to Rocky Linux. Rocky Linux 8 uses the new `AWS-DefaultRockyLinuxPatchBaseline` . For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL, CentOS Stream, and Rocky Linux.	April 14, 2022

Patch Manager now supports CentOS Stream 8	You can now use Patch Manager to patch CentOS Stream 8 instances and Red Hat Enterprise Linux (RHEL) 4.4-4.5 instances. Many of the rules that apply to RHEL 8 for patching also apply CentOS Stream 8. CentOS Stream 8 uses the `AWS-DefaultCentOSPatchBaseline` . For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL and CentOS Stream	April 4, 2022

Create an assume role for Change Manager	A new section clarifies the requirements for creating and implementing an *assume role* for Change Manager. An assume role is an AWS Identity and Access Management (IAM) service role that enables Change Manager to securely run the runbook workflows specified in an approved change request on your behalf. The role grants AWS Systems Manager (AWS STS) `AssumeRole` trust to Change Manager. For information, see Configuring roles and permissions for Change Manager.	March 18, 2022
Approve or reject Change Manager change requests in bulk	In the Systems Manager console, you can now select multiple change requests to approve or reject in a single operation. For information, see Reviewing and approving or rejecting change requests (console).	March 8, 2022

Support for Rocky Linux and Windows Server 2022 managed nodes	Systems Manager supports Rocky Linux and Windows Server 2022 managed nodes, including edge devices and hybrid machines located on-premises or with other cloud providers. To use Systems Manager with these operating systems, you must complete all required Systems Manager set up procedure s, including procedures for hybrid environments or edge devices, if applicable. For more information, see Setting up Systems Manager. For Rocky Linux machines, you must also manually install SSM Agent. For more information, see Manually install SSM Agent on Rocky Linux instances. For Windows Server 2022 Amazon Elastic Compute Cloud (Amazon EC2) instances, SSM Agent is installed by default.	March 1, 2022

Allow Automation to adapt to your concurrency needs and view Automation usage metrics	You can now allow Automation to automatically adjust your concurrent automation quota, and view Automation usage metrics that are published to CloudWatch. For more information about adaptive concurrency, see Allowing Automation to adapt to your concurrency needs. For more information about how to view Automation usage metrics, see Monitoring Automation metrics using Amazon CloudWatch.	January 27, 2022
Allow Automation to adapt to your concurrency needs and view Automation usage metrics	You can now allow Automation to automatically adjust your concurrent automation quota, and view Automation usage metrics that are published to CloudWatch. For more information about adaptive concurrency, see Allowing Automation to adapt to your concurrency needs. For more information about how to view Automation usage metrics, see Monitoring Automation metrics using Amazon CloudWatch.	January 27, 2022

Systems Manager documents organized by categories	Amazon owned Systems Manager documents are now organized by type and categories to help you find the documents you need.	January 13, 2022
Create and invoke integrations for Automation	You can now send messages using webhooks during an automation by creating an integration. Integrations can be invoked during an automation using the new `aws:invokeWebhook` action in your runbook. For more information about creating integrations, see Creating webhook integrations for Automation. To learn more about the `aws:invokeWebhook` action, see aws:invokeWebhook – Invoke an Automation webhook integration.	January 13, 2022
Capabilities not available in new AWS Region	The following Systems Manager tools currently aren't available in the new Asia Pacific (Jakarta) Region. • Application Manager • Change Calendar • Change Manager • Explorer • Fleet Manager • Incident Manager • Quick Setup	December 13, 2021

View resource cost details for an application	Application Manager is integrated with AWS Billing and Cost Management through the **Cost Explorer** widget. After you enable Cost Explorer in the Billing and Cost Management console, the Cost Explorer widget in Application Manager shows cost data for a specific non-container application or application component. You can use filters in the widget to view cost data according to different time periods, granularities, and cost types in either a bar or line chart. For more information, see Viewing overview information about an application.	December 7, 2021
Manage processes using Fleet Manager	You can now use Fleet Manager to manage processes on your nodes. For more information, see Working with processes.	December 6, 2021

Terminology change: managed instances are now managed nodes	With support for AWS IoT Greengrass core devices, the phrase *managed instance* has been changed to *managed node* in most of the Systems Manager documentation. The Systems Manager console, API calls, error messages, and SSM documents still use the term instance.	November 29, 2021

Support for edge devices	Systems Manager supports the following edge device configurations. • **AWS IoT Greengrass**: Systems Manager now supports any device that is configured for AWS IoT Greengrass and runs the AWS IoT Greengrass Core software. To onboard your AWS IoT Greengras s core devices, you must create an AWS Identity and Access Managemen t (IAM) service role. You must also use the AWS IoT Greengrass console to deploy SSM Agent as a AWS IoT Greengrass component on your devices. For more information, see Setting up AWS Systems Manager for edge devices. • **Edge devices in a hybrid environment**: Systems Manager also supports AWS IoT Core devices and non-AWS IoT devices after you configure them as on-premises machines. To onboard your devices, you must create an IAM service role, create a managed-n ode activation for a hybrid environment, and manually	November 29, 2021

	install SSM Agent on your devices. For more informati on, see Setting up AWS Systems Manager for hybrid environments	
Connect to managed instances using Remote Desktop	You can now use Fleet Manager to connect to managed Windows instances using the Remote Desktop Protocol (RDP). These Remote Desktop sessions powered by Amazon DCV provide secure connections to your instances directly from your browser. For more informati on, see Connect using Remote Desktop.	November 23, 2021
Specify a maximum session duration and provide reasons for sessions	You can now specify a maximum session duration for all Session Manager sessions in an AWS Region in your AWS account. When a session reaches reaches the duration you specify, it's terminated. You can now also optionally add a reason when starting a session. For more informati on, see Specify maximum session duration.	November 16, 2021

Patch Manager now supports the Raspberry Pi OS operating system	You can now use Patch Manager to patch Raspberry Pi OS instances. Patch Manager supports patching Raspberry Pi OS 9 (Stretch) and 10 (Buster). Because the Raspberry Pi OS is Debian-based OS, many of the same patching rules apply to it as to Debian Server. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server	November 16, 2021
Access the Red Hat Knowledgebase portal	Use Fleet Manager to access the RHEL Knowledgebase portal to find solutions, articles, documentation, and videos about using Red Hat products. For more informati on, see Accessing the Red Hat Knowledge base portal.	November 3, 2021
Bulk edit OpsItems	OpsCenter now supports bulk editing OpsItems. You can select multiple OpsItems and edit one of the following fields: **Status**, **Priority**, **Severity**, **Category**. For more information, see Editing OpsItems.	October 15, 2021

Create input parameters that populate AWS resources	You can now create input parameters in Automatio n runbooks that populate AWS resources in the AWS Management Console. For information, see Creating input parameters that populate AWS resources.	October 14, 2021
New task invocation cutoff option for maintenance windows	You can now choose to block any new task invocatio ns from starting after the cutoff time specified for a maintenance window is reached. For information, see Assign tasks to a maintenance window (console).	October 13, 2021
Patch Manager support for macOS 11.3.1 and 11.4 (Big Sur)	Amazon Elastic Compute Cloud (Amazon EC2) instances for macOS 11.3.1 and 11.4 (Big Sur) can now be patched using Patch Manager. This is in addition to existing support for macOS 10.14.x (Mojave) and 10.15.x (Catalina). For information about working with Patch Manager, see AWS Systems Manager Patch Manager.	October 1, 2021

Application insights in Application Manager	Application Manager integrates with Amazon CloudWatch Application Insights. Application Insights identifies and sets up key metrics, logs, and alarms across your application resources and technology stack. Application Insights continually monitors metrics and logs to detect and correlate anomalies and errors. When the system detects errors or anomalies, Application Insights generates CloudWatch Events that you can use to set up notificat ions or take actions. You can enable and view Applicati on Insights on the **Overview** and **Monitoring** tabs in Application Manager. For more information about Application Insights, see What is Amazon CloudWatc h Application Insights in the *Amazon CloudWatch User Guide*.	September 21, 2021

Import events from other calendars into Change Calendar	You can now import the events from a third-party calendar into a calendar in Change Calendar. Previously, each event had to be entered manually into a calendar. After you export a calendar from a supported third-par ty calendar provider to an iCalendar (`.ics`) file, import it into Change Calendar, and its events are included in the rules for your open or closed calendar in Systems Manager. Supported providers include iCloud Calendar, Google Calendar, and Microsoft Outlook. For more informati on, see Importing and managing events from third-party calendars.	September 8, 2021

New tagging and runbook features in Application Manager	Tagging enhancements include the ability to add tags to or delete tags from a specific resource or all resources in an Applicati on Manager application. Runbook enhancements include the ability to view a filtered list of runbooks for a specific resource type or initiate a runbook on all resources of the same type. For more information, see Working with tags in Applicati on Manager and Working with runbooks in Application Manager.	August 31, 2021
New example: Create a change request using the AWS CLI	An example of creating a change request with the AWS CLI has been added to the Change Manager chapter. The example uses the sample `AWS-HelloWorldChan geTemplate` change template and `AWS-Hello World runbook` : • Creating change requests (AWS CLI)	August 20, 2021

New section: Use parameters in Amazon EKS	A new section has been added to the Parameter Store chapter. This topic is a walkthrough on how to use your parameters in Amazon EKS clusters. For more information, see Use Parameter Store parameters in Amazon Elastic Kubernetes Service.	August 19, 2021
Updated Patch Manager lifecycle hooks	Patch Manager now provides a lifecycle hook–the ability to run a Systems Manager Command document–for an additional point during a **Patch now** patching operation. If you schedule instance reboots after running **Patch now**, you can specify a lifecycle hook to run after the reboot is complete. For more information, see Using 'Patch now' lifecycle hooks and About the `AWS-RunPatchBaselineWithHooks` SSM document.	August 9, 2021

Auto-approvals now supported for Change Manager requests	You can now configure change templates in Change Manager to support automatic approvals, meaning that users with the necessary IAM permissions can choose to start the change request without requiring additiona l approval. Users who have access to auto-approval templates can still choose to specify approvers if they choose. To help you control your Change Manager processes, approvals are still required for all requests during change freeze periods. For more information, see the following topics: • Creating change templates • Creating change requests • Try out the AWS managed `Hello World` change template	July 30, 2021

OpsCenter operational insights	OpsCenter automatically analyzes OpsItems in your account and generates *insights*. An insight includes information to help you understand how many duplicate OpsItems are in your account and which sources are creating them. Insights also provide recommended best practices and Automation runbooks to help you resolve duplicate OpsItems. For more informati on, see Working with operational insights.	July 13, 2021
View stopped instances in Fleet Manager	You can now view which instances are `running` and which instances are `stopped` from the Fleet Manager console. For more information, see AWS Systems Manager Fleet Manager.	July 12, 2021
New topic: Authoring Automation runbooks	A new topic, Authoring Automation runbooks, provides guidance and narrative examples of how to author content for custom Automation runbooks.	July 8, 2021

AWS CloudFormation stack and template creation in Application Manager	Application Manager helps you provision and manage resources for your applications by integrating with CloudFormation. You can create, edit, and delete CloudFormation templates and stacks in Application Manager. Application Manager also includes a template library where you can clone, create, and store templates. Application Manager and CloudFormation display the same information about the current status of a stack. Templates and template updates are stored in Systems Manager until you provision the stack, at which time the changes are also displayed in CloudFormation. For more information, see Working with CloudFormation Stacks in Application Manager.	July 8, 2021
New topic: Automatically rotate private keys for SSM Agent on hybrid instances	A new topic, Setting up private key auto rotation, provides instructions on how to strengthen your security posture by configuring SSM Agent to rotate the hybrid environment private key automatically.	June 15, 2021

Session Manager plugin for the AWS CLI version 1.2.205.0	A new version of the Session Manager plugin for the AWS CLI has been released. For more information, see Session Manager plugin latest version and release history.	June 10, 2021
New IAM service-linked role	When you enable OpsCenter operational insights, Systems Manager creates a new AWS Identity and Access Management (IAM) service-linked role called `AWSSSMOpsInsightsServiceRolePolicy`. For more information about this role, see Using roles to create operational insight OpsItems in Systems Manager OpsCenter: `AWSSSMOpsInsightsServiceRolePolicy`.	June 9, 2021
New Patch Manager troubleshooting content for Linux	A new topic, Errors when running `AWS-RunPatchBaseline` on Linux, provides descriptions and solutions for several issues that might be encountered when patching managed instances with Linux operating systems.	June 8, 2021

Improved support for maintenance window tasks that don't require specified targets (console)	You can now create maintenance window tasks in the console without having to specify a target in the task if one isn't required. Previously, this option was available only when using the AWS CLI or API. This option applies to Automation, AWS Lambda, and AWS Step Functions task types. For example, if you create an Automation task and the resources to update are specified in the Automation document parameters, you no longer need to specify a target in the task itself. For more information, see Registering maintenance window tasks without targets, Assign tasks to a maintenance window (console), and Schedule automations with maintenance windows.	May 28, 2021
Automation Runbook Reference relocated	The Automation Runbook Reference has been moved to a new location. For more information, see Systems Manager Automation Runbook Reference.	May 10, 2021

AWS Systems Manager Incident Manager launch	Incident Manager is an incident management console designed to help users mitigate and recover from incidents affecting their AWS hosted applications. For more information, see the AWS Systems Manager Incident Manager User Guide.	May 10, 2021
State Manager supports Change Calendar	You can now specify Change Calendar names or Amazon Resource Names (ARNs) when you create or update a State Manager association. State Manager applies associati ons only when the change calendar is open, not when it's closed. For more information, see Creating associations and Editing and creating a new version of an association.	May 6, 2021
Clone Systems Manager documents	Using the Systems Manager Documents console, you can now copy content from an existing document to a new document that you can modify. To learn more, see Cloning an SSM document.	May 4, 2021

Integrate Security Hub CSPM with Explorer and OpsCenter	You can now integrate Explorer and OpsCenter with AWS Security Hub CSPM. Security Hub CSPM provides a comprehensive view of your security state in AWS and helps you check your environment against security industry standards and best practices. When integrate d with Explorer, you can view security findings in the Security Hub CSPM widget on the Explorer dashboard. When integrated with OpsCenter, you can create OpsItems for Security Hub CSPM findings. For more information, see Receiving findings from AWS Security Hub CSPM in Explorer and Receiving findings from AWS Security Hub CSPM in OpsCenter.	April 27, 2021
New topic: Document conventions	We've added a new topic to help users understand the common typographical conventions for the *AWS Systems Manager User Guide*. For more information, see Document conventions.	April 21, 2021

Updated topic: About patching applications released by Microsoft on Windows Server	The topic About patching applications released by Microsoft on Windows Server now clarifies that, in order for Patch Manager to be able to patch applications released by Microsoft on your Windows Server managed instances, the Windows update option **Give me updates for other Microsoft products when I update Windows** must be allowed on the instance.	April 12, 2021
Automation Runbook Reference reorganization	To help you find the runbooks you need and navigate the reference more efficient ly, we reorganized the content in the Automatio n Runbook Reference by the relevant AWS service. To view these changes, see Systems Manager Automation Runbook Reference.	April 12, 2021

Patch Manager: Generate .csv patch compliance reports	Patch Manager now supports the ability to generate patch compliance reports for your instances and save the report in an S3 bucket of your choice, in .csv format. Then, using a tool like Amazon Quick Suite, you can analyze the patch compliance report data. You can generate a patch compliance report for a single instance, or for all instances in your AWS account. You can generate a one-time report on demand, or set up a schedule for reports to be created automatic ally. You can also specify an Amazon Simple Notificat ion Service topic to provide notifications when a report is generated. For more informati on, see Generating CSV patch compliance reports.	April 9, 2021
Delete Parameter Store parameter labels	You can now delete Parameter Store parameter labels by using either the Systems Manager console or the AWS CLI. For more information, see Working with parameter labels.	April 6, 2021

Schedule instance reboots when using Patch Now	Patch Manager now supports scheduling a time for your instances to reboot after patches are installed using the Patch Now feature. This is in addition to existing options to reboot instances only if needed to complete a patch installation or to skip all rebooting after the patching operation. For information, see Patching instances on demand.	April 1, 2021
New topic: Discover public parameters	Parameter Store public parameters can now be found using the AWS CLI or Systems Manager console. For more information, see Finding public parameters.	April 1, 2021

Patch now updates: Store logs in S3 & and run lifecycle hooks	When you run the Patch Manager **Patch now** operation, you can choose an S3 bucket in which to automatically store patching logs. In addition, you can choose to run Systems Manager Command documents (SSM documents) as lifecycle hooks at three points during the operation : *Before installation*, *After installation*, and *On exit*. For more information, see Patching instances on demand.	March 31, 2021
Systems Manager now reports changes to its AWS managed policies	Beginning March 24, 2021, changes to managed policies are reported in the topic Systems Manager updates to AWS managed policies. The first change listed is the addition of support for the Explorer tool to report OpsData and OpsItems from multiple accounts and Regions.	March 24, 2021

Explorer automatically allows all OpsData sources for resource data syncs based on accounts in AWS Organizations	When you create a resource data sync, if you choose one of the AWS Organizations options, Systems Manager automatically allows all OpsData sources in the selected AWS Regions for all AWS accounts in your organization (or in the selected organization units). This means, for example, that even if you haven't allowed Explorer in an AWS Region, if you select an AWS Organizations option for your resource data sync, then Systems Manager automatically collects OpsData from that Region. For more information, see About multiple account and Region resource data syncs.	March 24, 2021
Systems Manager Automation provides a new system variable for your runbooks	With the new `global:AWS_PARTITION` system variable, you can specify the AWS partition a resource is located in when authoring your runbooks. For more information, see Automation system variables.	March 18, 2021

Allow multiple levels of approval for Change Manager change requests	When you create a Change Manager change template, you can now require that more than one level of approvers grant permissio n for a change request to run. For example, you might require technical reviewers to approve a change request created from a change template first, and then require a second level of approvals from one or more managers. For more informati on, see Creating change templates.	March 4, 2021
Patch Manager now supports Oracle Linux 8.x	You can now use Patch Manager to patch Oracle Linux 8.x instances, through version 8.3. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Oracle Linux	March 1, 2021

OpsCenter displays other OpsItems for a selected resource	To help you investigate issues and provide context for a problem, you can view a list of OpsItems for a specific AWS resource. The list displays the status, severity, and title of each OpsItem. The list also includes deep links to each OpsItem. For more information, see Viewing other OpsItems for a specific resource.	March 1, 2021
Define patching preferences at runtime	You can now define patching preferences at runtime using the baseline override feature. For information more, see Using the BaselineOverride parameter.	February 25, 2021
New Systems Manager document type	AWS CloudFormation templates can now be stored as Systems Manager documents. Storing CloudFormation templates as Systems Manager documents allows you to benefit from Systems Manager document features like versioning, comparing version content, and sharing with accounts. For more information, see AWS Systems Manager documents.	February 9, 2021

Patch instances using optional hooks	The new SSM document `AWS-RunPatchBaselineWithHooks` provides hooks you can use to run SSM documents at three points during the instance patching cycle. For information about `AWS-RunPatchBaselineWithHooks`, see About the `AWS-RunPatchBaselineWithHooks` SSM document. For a sample walkthrough of a patching operation that uses all three hooks, see Walkthrough: Update application dependencies, patch an instance, and perform an application-specific health check.	February 2, 2021

New topic: Validating on-premises servers and virtual machines using a hardware fingerprint	SSM Agent verifies the identify of on-premises servers and virtual machines and VMs that you register with the service by using a computed *fingerprint*. The fingerprint is an opaque string, stored in the *Vault* that the agent passes to certain Systems Manager APIs. For information about the hardware fingerprint and instructions for configuri ng a *similarity threshold* to assist in machine verification, see Validating on-premises servers and virtual machines using a hardware fingerprint.	January 25, 2021
New topic: SSM Agent technical reference	The topic SSM Agent technical reference brings together information to help you implement AWS Systems Manager SSM Agent and understand how the agent works. This topic includes an all-new section, SSM Agent rolling updates by AWS Regions.	January 21, 2021

SSM Agent on Windows Server 2008	As of January 14, 2020, Windows Server 2008 is no longer supported for feature or security updates from Microsoft. Windows Server 2008 AMIs do include SSM Agent, but the agent is no longer updated for this operating system.	January 5, 2021
Improved support for maintenance window tasks that don't require specified targets (AWS CLI and API only)	You can now create maintenance window tasks without having specify a target in the task if one isn't required (AWS CLI and API only). This applies to Automation, AWS Lambda and AWS Step Functions task types. For example, if you create an Automation task and the resources to update are specified in the Automatio n runbook parameters, you no longer need to specify a target in the task itself. For more information, see Registering maintenance window tasks without targets and Schedule automations with maintenance windows.	December 23, 2020

New Automation features	A new shared property has been added to Systems Manager Automation runbooks. The `onCancel` property allows you to specify which step the automation should go to in the event that a user cancels the automatio n. For more information, see Properties shared by all actions.	December 21, 2020
New topic: Working with associations using IAM	A new topic has been added to the Systems Manager State Manager chapter that describes the best practices for creating associations using IAM. For more information, see Working with associations using IAM.	December 18, 2020
State Manager now supports multi-regions and multi-acc ounts	Associations can now be created or updated with multiple regions or accounts. For more information, see Creating associations.	December 15, 2020

New tool: Fleet Manager	Fleet Manager, a tool in AWS Systems Manager, is a unified user interface (UI) experience that helps you remotely manage your server fleet running on AWS, or on-premises. With Fleet Manager, you can view the health and performance status of your entire server fleet from one console. You can also gather data from individua l instances to perform common troubleshooting and management tasks from the console. For information, see AWS Systems Manager Fleet Manager.	December 15, 2020

New tool: Change Manager	Amazon Web Services has released Change Manager, an enterprise change management framework for requesting, approving, implementing, and reporting on operational changes to your application configura tion and infrastructure. From a single *delegated administrator account*, if you use AWS Organizations, you can manage changes across multiple AWS accounts in multiple AWS Regions. Alternatively, using a *local account*, you can manage changes for a single AWS account. Use Change Manager for managing changes to both AWS resources and on-premises resources. For information, see AWS Systems Manager Change Manager.	December 15, 2020

New tool: Application Manager	Application Manager helps you investigate and remediate issues with your AWS resources in the context of your applicati ons. Application Manager aggregates operations information from multiple AWS services and Systems Manager tools to a single AWS Management Console. For information, see AWS Systems Manager Application Manager.	December 15, 2020

AWS Systems Manager supports Amazon EC2 instances for macOS	In tandem with the release of Amazon Elastic Compute Cloud (Amazon EC2) support for macOS instances, Systems Manager now supports many operations on EC2 instances for macOS. Supported versions include macOS 10.14.x (Mojave) and 10.15.x (Catalina). For more informati on, see the following topics. • For information about installing SSM Agent on EC2 instances for macOS, see Installing and configuri ng SSM Agent on EC2 instances for macOS.. • For information about patching EC2 instances for macOS, see How patches are installed, and Creating a custom patch baseline (macOS). • For general information about support for EC2 instances for macOS, see Amazon EC2 Mac instances in the *Amazon EC2 User Guide*.	November 30, 2020

Maintenance window pseudo parameters: New resource type supported for {{TARGET_ID}} and {{RESOURCE_ID}}	An additional resource type is now available for use with the pseudo parameters {{TARGET_ID}} and {{RESOURCE_ID}}. You can now use the resource type AWS::RDS::DBCluster with both these pseudo parameters. For information about maintenance window pseudo parameters, see Using pseudo parameters when registering maintenance window tasks.	November 27, 2020
Session Manager plugin for the AWS CLI version 1.2.30.0	A new version of the Session Manager plugin for the AWS CLI has been released. For more information, see Session Manager plugin latest version and release history.	November 24, 2020
New topic: Comparing SSM document versions	You can now compare the differences in content between versions of SSM documents in the Systems Manager Documents console. For more information, see Comparing SSM document versions.	November 24, 2020
Systems Manager now supports VPC endpoint policies	You can now create policies for VPC interface endpoints for Systems Manager. For more information, see Create an interface VPC endpoint policy.	November 18, 2020

New topic: Specify an idle session timeout value	You can now specify the amount of time to allow a user to be inactive before a session ends with Session Manager. For more informati on, see Specify an idle session timeout value.	November 18, 2020
New Session Manager logging feature	You can now send a continual stream of JSON-formatted session data logs to Amazon CloudWatch Logs. For more information, see Streaming session data using Amazon CloudWatch Logs.	November 18, 2020
New topic: Verify the signature of the SSM Agent	You can now verify the cryptographic signature of the installer package for the SSM Agent on Linux instances . For more information, see SSM document schemas and features.	November 17, 2020
New topic: Understanding automation statuses	A new topic has been added to the Systems Manager Automation chapter that describes the statuses for actions and automations. For more information, see Understanding automation statuses.	November 17, 2020

New source types for the `aws:downloadContent` plugin	Git and HTTP are now supported as source types for the `aws:downloadContent` plugin. For more information, see `aws:downloadContent`.	November 17, 2020
New Systems Manager document (SSM document) schema feature	In SSM documents with schema version 2.2 or later, the `precondition` parameter now supports referencing your document's input parameters. For more information, see SSM document schemas and features.	November 17, 2020
New data source in Explorer: AWS Config	Explorer now displays information about AWS Config compliance, including an overall summary of compliant and non-compliant AWS Config rules, the number of compliant and non-compliant resources, and specific details about each (when you drill down into a non-compliant rule or resource). For more information, see Editing Systems Manager Explorer data sources.	November 11, 2020

New topic: Running Auto Scaling groups with associations	A new section has been added to State Manager that describes the best practices for creating associations to run Auto Scaling groups. For more information, see Running Auto Scaling groups with associations.	November 10, 2020
Quick Setup now supports targeting a resource group	Quick Setup now supports choosing a resource group as a target for the local setup type. For more information, see Choosing Targets for Quick Setup.	November 5, 2020
Patch Manager adds support for Debian Server 10 LTS, Oracle Linux 7.9 LTS, and Ubuntu Server 20.10 STR	You can now use Patch Manager to patch Debian Server 10 LTS, Oracle Linux 7.9 LTS, and Ubuntu Server 20.10 STR instances. For more information, see the following topics: • Patch Manager prerequisites • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server • How patch baseline rules work on Oracle Linux • How patch baseline rules work on Ubuntu Server	November 4, 2020

New EventBridge support for AWS Systems Manager Change Calendar	Amazon EventBridge now provides support for Change Calendar events events in event rules. When the state of a calendar changes, EventBridge can initiate the target action you defined an EventBridge rule. For information about working with EventBridge and Systems Manager events, see the following topics. • Configuring EventBridge for Systems Manager events • Reference: Amazon EventBridge event patterns and types for Systems Manager	November 4, 2020
Configure CloudWatch to create OpsItems from alarms	You can configure Amazon CloudWatch to automatically create an OpsItem in Systems Manager OpsCenter when an alarm enters the `ALARM` state. Doing so allows you to quickly diagnose and remediate issues with AWS resources from a single console. For more information, see Configuring CloudWatch to create OpsItems from alarms.	November 4, 2020

Support for Ubuntu Server 20.10	AWS Systems Manager now supports Ubuntu Server 20.10 short-term release (STR). For more information, see the following topics: • Supported operating systems • Install SSM Agent for a hybrid environment (Linux) • Manually install SSM Agent on Ubuntu Server instances • Checking SSM Agent status and starting the agent	October 22, 2020
New topic: Allow configurable shell profiles	You can now allow configurable shell profiles with Session Manager. By allowing configurable shell profiles, you can customize preferences within sessions such as shell preferences, environment variables, working directories, and running multiple commands when a session is started. For more information, see Allow configurable shell profiles.	October 21, 2020

Patch compliance results now report which CVEs are resolved by which patches	For most supported Linux systems, when you view patch compliance results for your managed instances , the details you can view now report which Common Vulnerabilities and Exposure (CVE) bulletin issues are resolved by which available patches. This information can help you determine how urgently you need to install a missing or failed patch. For more information, see Viewing patch compliance results.	October 20, 2020

Expanded support for Linux patch metadata	You can now view many details about available Linux patches in Patch Manager. You can choose to view patch data such as architecture, epoch, version, CVE ID, Advisory ID, Bugzilla ID, repository, and more. In addition, the DescribeAvailablePatches API operation has been updated to support Linux operating systems and filtering according to these newly available patch metadata types. For more information, see the following topics: • Viewing available patches • DescribeAvailablePatches and Patch in the *AWS Systems Manager API Reference* • describe-available-patches in the *AWS Systems Manager section of the AWS CLI Command Reference*	October 16, 2020
Session Manager plugin for the AWS CLI version 1.2.7.0	A new version of the Session Manager plugin for the AWS CLI has been released. For more information, see Session Manager plugin latest version and release history.	October 15, 2020

New topic: Session document schema	The new topic Session document schema describes the schema elements for a Session document. This information can help you create custom Session documents where you specify preferences for the types of sessions you use with Session Manager.	October 15, 2020
New topic: Free text search for SSM documents	The search box on the Systems Manager **Documents** page now supports free text search. Free text search compares the search term or terms that you enter against the document name in each SSM document. For more information, see Using free text search.	October 15, 2020
New topic: Troubleshooting Amazon EC2 managed instance availability	The new topic Troublesh ooting Amazon EC2 managed instance availability helps you investigate why an Amazon EC2 instance that you have confirmed is running isn't available in lists of available managed instances in Systems Manager.	October 6, 2020

Parameter Store chapter reorganization	To help you find the information you need more efficiently, we reorganized content in the Parameter Store chapter of the *AWS Systems Manager User Guide*. Most content is now organized in the sections Setting up Parameter Store and Working with Parameter Store. In addition, the topic AWS Systems Manager Parameter Store has been expanded to include the following sections: • How can Parameter Store benefit my organization? • Who should use Parameter Store? • What are the features of Parameter Store? • What is a parameter?	October 1, 2020

New patch compliance-related topics	The following topics have been added to help you identify managed instances that are out of patch compliance, understand the different types of patch compliance scans, and take the appropriate steps to bring your instances into compliance. • Identifying noncompliant instances • Patching noncompliant instances • Viewing patch compliance results	September 24, 2020
SSM Agent version 3.0	Systems Manager launched a new version of SSM Agent.	September 21, 2020

New and updated topics: Amazon EventBridge replaces CloudWatch Events for event management	CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides more features and is now the preferred way to manage your events in AWS. (Changes you make in either CloudWatch or EventBridge are reflected in each console.) References to CloudWatch Events and existing procedures throughout the *AWS Systems Manager User Guide* have been updated to reflect EventBridge support. In addition, the following new topics have been added. • Monitoring Systems Manager events • Configuring EventBridge for Systems Manager events • Systems Manager target type examples • Reference: Amazon EventBridge event patterns and types for Systems Manager	September 18, 2020

Integrating AWS Security Hub CSPM and Patch Manager	You can now integrate Patch Manager with AWS Security Hub CSPM. Security Hub CSPM provides a comprehensive view of your security state in AWS and helps you check your environment against security industry standards and best practices. When integrated with Patch Manager, Security Hub CSPM monitors the patching status of your fleets from a security point of view. For more information, see Integrating Patch Manager with AWS Security Hub CSPM.	September 17, 2020

Maintenance window pseudo parameters: New resource types supported for {{TARGET_ID}} and {{RESOURCE_ID}}	When you register a maintenance window task, you use the `--task-invocation-parameters` option to specify the parameters that are unique to each of the four task types. You can also reference certain values using *pseudo parameter* syntax, such as {{TARGET_ID}} and {{RESOURCE_ID}}. When the maintenance window task runs, it passes the correct values instead of the pseudo parameter placeholders. Two additional resource types are now available for use with the pseudo parameters {{TARGET_ID}} and {{RESOURCE_ID}}. You can now use the resources types `AWS::RDS::DBInstance` and `AWS::SSM::ManagedInstance` with both these pseudo parameters. For information about maintenance window pseudo parameters, see Using pseudo parameters when registering maintenance window tasks.	September 14, 2020

Patch instances on demand with new '**Patch now**' option	You can now use the Systems Manager console to patch instances, or scan for missing patches, at any time. You can do this without having to create or modify a schedule, or specify full patching configuration options to accommodate an immediate patching need. You need only specify whether to scan or install patches and identify the target instances for the operation. Patch Manager automatically applies the current default patch baseline for your instance types and applies best practice options for how many instances are patched at once, and how many errors are permitted before the operation fails. For more information, see Patching instances on demand.	September 9, 2020
New topic: Checking SSM Agent status and starting the agent	The new topic Checking SSM Agent status and starting the agent provides commands to check whether SSM Agent is running on each supportin g operating system. It also provides the commands to start the agent if it isn't running.	September 7, 2020

Patch Manager now supports Ubuntu Server 20.04 LTS	You can now use Patch Manager to patch Ubuntu Server 20.04 LTS instances. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Ubuntu Server	August 31, 2020
New topic for Use cases and best practices	We've added a new topic to help users quickly understan d the differences between Maintenance Windows and State Manager. For more information, see Choosing between State Manager and Maintenance Windows.	August 28, 2020
New OpsCenter features	OpsCenter include new features to help you quickly locate and run Automation runbooks to remediate issues. For more information, see Automation runbook features in OpsCenter.	August 19, 2020
New data source in Explorer: AWS Support cases	Explorer now displays information about Support cases. You must have either an Enterprise or Business account set up with Support. For more information, see Editing Systems Manager Explorer data sources.	August 13, 2020

Distributor now provides a third-party package from Trend Micro.	Distributor now includes a third-party package from Trend Micro. You can use Distributor to install the Trend Micro Cloud One agent on your managed instances. Trend Micro Cloud One helps you secure your workloads in the cloud. For more informati on, see AWSDistributor.	August 12, 2020
The `aws:configurePacka ge` document plugin now includes the additiona lArguments parameter.	The Systems Manager Command document plugin `aws:configurePacka ge` now supports providing additional parameters to your scripts (install, uninstall , and update) with the new `additionalArgument s` parameter. For more information, see the topic `aws:configurePackage` .	August 11, 2020
AppConfig content moved into a separate user guide	Information about AWS AppConfig has been moved into a separate user guide. For more information, see What Is AWSAppConfig? AppConfig also has a separate documentation landing page with links to the user guide, the AppConfig API reference , and a new AppConfig workshop.	August 3, 2020

Quick Setup now supports AWS Organizations	Quick Setup now supports AWS Organizations allowing you to quickly configure required security roles and commonly used Systems Manager tools across multiple accounts and Regions. For more information, see AWS Systems Manager Quick Setup.	July 23, 2020
New data source in Explorer: association compliance	Explorer now displays association compliance data from State Manager. For more information, see Editing Systems Manager Explorer data sources .	July 23, 2020
New Systems Manager Command document to turn on and turn off Kernel Live Patching	The document `AWS-ConfigureKernelLivePatching` is now available to use with Run Command when you want to turn on or turn off Kernel Live Patching on Amazon Linux 2 instances. This document replaces the need for creating your own custom Command documents for these tasks. For more information, see Use Kernel Live Patching on Amazon Linux 2 instances	July 22, 2020

Updated Automation quotas	Service quotas for Automation have been updated including a separate queue for rate control automations. For more information, see AWS Systems Manager Automation.	July 20, 2020
Specify the number of schedule offset days for a maintenance window using the console	Using the Systems Manager console, you can now specify a number of days to wait after the date and time specified by a CRON expression before running a maintenance window. (Previously, this option was available only when using an AWS SDK or a command line tool.) For example, if your CRON expression schedules a maintenance window to run on the third Tuesday of every month at 11:30 PM – `cron(0 30 23 ? * TUE#3 *)` – and you specify a schedule offset of 2, the window won't run until two days later at 11:30 PM. For more information, see Cron and rate expressions for Systems Manager and Specify the number of schedule offset days for a maintenance window.	July 17, 2020

Update PowerShell using Run Command	To help you update PowerShell to version 5.1 on your Windows Server 2012 and 2012 R2 instances, we added a walkthrough to the AWS Systems Manager User Guide. For more information, see Update PowerShell using Run Command.	June 30, 2020
Patch Manager now supports CentOS 8.0 and 8.1	You can now use Patch Manager to patch CentOS 8.0 and 8.1 instances. For more information, see the the following topics: • How security patches are selected • How patches are installed • How to install the SSM Agent on hybrid Linux nodes	June 27, 2020

AppConfig integrates with AWS CodePipeline	AppConfig is an integrated deploy action for AWS CodePipeline (CodePipeline). CodePipeline is a fully managed continual delivery service that helps you automate your release pipelines for fast and reliable application and infrastructure updates. CodePipeline automates the build, test, and deploy phases of your release process every time there is a code change, based on the release model you define. The integration of AppConfig with CodePipeline offers the following benefits. For more information, see AppConfig integration with CodePipeline. • Customers who use CodePipeline to manage orchestration now have a lightweight means of deploying configuration changes to their applications without having to deploy their entire codebase. • Customers who want to use AppConfig to manage configuration deployments but are limited because AppConfig doesn't support their current code or	June 25, 2020

	configuration store, now have additional options. CodePipeline supports AWS CodeCommit, GitHub, and BitBucket (to name a few).	
New chapter: Product and service integrations	To help you understand how Systems Manager integrates with AWS services and other products and services, a new chapter has been added to the AWS Systems Manager User Guide. For more information, see Product and service integrations with Systems Manager.	June 23, 2020
Automation chapter reorganization	To help you find what you need, we reorganized topics in the Automation chapter of the *AWS Systems Manager User Guide*. For example, the Automation actions and Automation runbooks references are now top-level sections in the chapter. For more information, see AWS Systems Manager Automation.	June 23, 2020

Specify the number of schedule offset days for a maintenance window	Using a command line tool or AWS SDK, you can now specify a number of days to wait after the date and time specified by a CRON expression before running a maintenance window. For example, if your CRON expression schedules a maintenance window to run on the third Tuesday of every month at 11:30 PM – `cron(0 30 23 ? * TUE#3 *)` – and you specify a schedule offset of 2, the window won't run until two days later at 11:30 PM. For more information, see Cron and rate expressions for Systems Manager and Specify the number of schedule offset days for a maintenance window.	June 19, 2020
Patch Manager support for Kernel Live Patching on Amazon Linux 2 instances	Kernel Live Patching for Amazon Linux 2 allows you to apply security vulnerability and critical bug patches to a running Linux kernel, without reboots or disruptions to running applications. You can now allow the feature and apply kernel live patches using Patch Manager. For information, see Use Kernel Live Patching on Amazon Linux 2 instances.	June 16, 2020

Patch Manager increases Oracle Linux version support	Previously, Patch Manager supported only version 7.6 of Oracle Linux. As listed in Patch Manager prerequisites, support now covers versions 7.5-7.8.	June 16, 2020
Sample scenario for using the `InstallOverrideList` parameter in patching operations	The new topic Sample scenario for using the `InstallOverrideList` parameter describes a strategy for using the `InstallOverrideList` parameter in the `AWS-RunPatchBaseline` document to apply different types of patches to a target group, on different maintenance window schedules, while still using a single patch baseline.	June 11, 2020
Predefined deployment strategies for AppConfig	AppConfig now offers predefined deployment strategies. For more information, see Creating a deployment strategy.	June 10, 2020

Patch Manager now supports Red Hat Enterprise Linux (RHEL) 7.8-8.2	You can now use Patch Manager to patch RHEL 7.8–8.2 instances. For more information, see the the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL • Manually install SSM Agent on Red Hat Enterprise Linux instances • How to install the SSM Agent on hybrid Linux nodes	June 9, 2020

Explorer supports delegated administration	If you aggregate Explorer data from multiple AWS Regions and AWS accounts by using resource data sync with AWS Organizations, then we suggest that you configure a delegated administrator for Explorer. A delegated administrator improves Explorer security by limiting the number of Explorer administrators who can create or delete multi-account and Region resource data syncs to only one individual. You also no longer need to be logged into the AWS Organizations management account to administer resource data syncs in Explorer. For more information, see Configuring a Delegated Administrator.	June 3, 2020
Apply State Manager association only at the next specified Cron interval	If you don't want a State Manager association to run immediately after you create it, you can choose the **Apply association only at the next specified Cron interval** option in the Systems Manager console. For more information, see Creating associations.	June 3, 2020

New data source in Explorer: AWS Compute Optimizer	Explorer now displays data from AWS Compute Optimizer. This includes a count of **Under provisioned** and **Over provisioned** EC2 instances, optimization findings, on-demand pricing details, and recommendations for instance type and price. For more information, see the details for setting up AWS Compute Optimizer in Setting up related services.	May 26, 2020
Install Windows Service Packs and Linux minor version upgrades using Patch Manager	The new topic Tutorial: Create a patch baseline for installing Windows Service Packs (console) demonstrates how you can create a patch baseline devoted exclusively to installing Windows Service Packs. The topic Create a custom patch baseline (Linux) has been updated with information about including minor version upgrades for Linux operating systems in patch baselines.	May 21, 2020

Parameter Store chapter reorganization	All topics that deal with configuring or setting options for Parameter Store operations have been consolidated into the Setting up Parameter Store section. This includes the topics Managing parameter tiers and Increasing Parameter Store throughput, which have been relocated from other parts of the chapter.	May 18, 2020
New topic for creating date and time strings for interacting with Systems Manager API operations.	The new topic Creating formatted date and time strings for Systems Manager describes how to create formatted date and time strings for interacting with Systems Manager API operations.	May 13, 2020
About permissions for encrypting SecureString parameters	The new topic Restricting access to Systems Manager parameters using IAM policies explains the difference between encrypting your `SecureString` parameters using an AWS KMS key and using the AWS managed key provided by AWS.	May 13, 2020

Patch Manager now supports the Debian Server and Oracle Linux 7.6 operating systems	You can now use Patch Manager to patch Debian Server and Oracle Linux instances. Patch Manager supports patching Debian Server 8.x and 9.x and Oracle Linux 7.6 versions. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server • How patch baseline rules work on Oracle Linux	May 7, 2020
Create State Manager associations that target AWS Resource Groups	In addition to targeting tags, individual instances, and all instances in your AWS account, you can now create State Manager associations that target instances in AWS Resource Groups. For more information, see About targets and rate controls in State Manager associations	May 7, 2020

New `aws:ec2:image` data type in Parameter Store to validate AMI IDs	When you create a `String` parameter, you can now specify a *data type* as `aws:ec2:image` to ensure that the parameter value you enter is a valid Amazon Machine Image (AMI) ID format. Support for AMI ID formats means you don't have to update all your scripts and templates with a new ID each time the AMI that you want to use in your processes changes. You can create a parameter with the data type `aws:ec2:image` , and for its value, enter the ID of an AMI. This is the AMI from which you want new instances to be created. You then reference this parameter in your templates, commands. When you're ready to use a different AMI, update the parameter value. Parameter Store validates the new AMI ID, and you don't need to update your scripts and templates. For more informati on, see Native parameter support for Amazon Machine Image IDs.	May 5, 2020

Managing exit codes in Run Command commands	Run Command enables you to define how exit codes are handled in your scripts. By default, the exit code of the last command run in a script is reported as the exit code for the entire script. However, you can include a shell conditional statement to exit the script if any command before the final one fails using the following approach. For examples, see the new topic Managing exit codes in Run Command commands.	May 5, 2020
New public parameters released for availability zones and local zones	Public parameters have been released to make information about AWS *availability zones* and *local zones* available programmatically. These are in addition to existing global infrastructure public parameters for AWS services and AWS Regions. For more information, see Calling public parameters for AWS services, Regions, endpoints, Availability Zones, local zones, and Wavelength Zones .	May 4, 2020

New data source in Explorer: AWS Trusted Advisor	Explorer now displays data from AWS Trusted Advisor. This includes the status of best practice checks and recommendations in the following areas: cost optimization, security, fault tolerance, performance, and service quotas. For more information, see the details for setting up Trusted Advisor in Setting up related services.	May 4, 2020

Create State Manager associations that run Chef recipes	You can create State Manager associations that run Chef cookbooks and recipes by using the `AWS-ApplyChefRecipes` document. This document offers the following benefits for running Chef recipes: • Supports multiple releases of Chef (Chef 11 through Chef 14). • Automatically installs the Chef client software on target instances. • Optionally runs Systems Manager compliance checks on target instances , and stores the results of compliance checks in an S3 bucket. • Runs multiple cookbooks and recipes in a single run of the document. • Optionally runs recipes in `why-run` mode, to show which recipes will change on target instances without making changes. • Optionally applies custom JSON attributes to `chef-client` runs.	March 19, 2020

	For more information, see Creating associations that run Chef recipes	
Synchronize inventory data from multiple AWS accounts to a central Amazon S3 bucket	You can synchronize Systems Manager Inventory data from multiple AWS accounts to a central S3 bucket. The accounts must be defined in AWS Organizations. For more information, see Creating an Inventory resource data sync for multiple accounts defined in AWS Organizations.	March 16, 2020
Store AppConfig configurations in Amazon S3	Previously, AppConfig only supported application configurations that were stored in Systems Manager (SSM) documents or Parameter Store parameters. In addition to these options, AppConfig now supports storing configurations in Amazon S3. For more information, see About configurations stored in Amazon S3.	March 13, 2020
SSM Agent installed by default on Amazon ECS-optimized AMIs	SSM Agent is now installed by default on Amazon ECS-Optimized AMIs. For more information, see Working with SSM Agent.	February 25, 2020

Create AppConfig configurations in the console	AppConfig now allows you to create an application configuration in the console at the time you create a configuration profile. For more information, see Creating a configuration and a configuration profile.	February 13, 2020
Auto-approve only patches released up to a specified date	In addition to the option for automatically approving patches for installation a specified number of days after they're released, Patch Manager now supports the ability to auto-approve only patches released on or before a date that you specify. For example, if you specify July 7, 2020, as the cutoff date in your patch baseline, no patches released on or after July 8, 2020, are installed automatically. For more information, see About custom baselines and Working with custom patch baselines (console).	February 12, 2020

Use the {{RESOURCE_ID}} pseudo parameter in maintenance window tasks	When you register a maintenance window task, you specify the parameters that are unique to the task type. You can reference certain values using pseudo parameter syntax, such as `{{TARGET_ID}}`, `{{TARGET_TYPE}}`, and `{{WINDOW_TARGET_ID}}`. When the maintenance window task runs, it passes the correct values instead of the pseudo parameter placeholders. To support resources that are part of a resource group as a target, you can use the `{{RESOURCE_ID}}` pseudo parameter to pass values for resources such as DynamoDB tables, S3 buckets, and other supported types. For more information, see the following topics in Tutorial: Create and configure a maintenance window (AWS CLI): • Using pseudo parameters when registering maintenance window tasks • Examples: Register tasks with a maintenance window	February 6, 2020

Quickly rerun commands	Systems Manager includes two options to help you rerun a command from the **Run Command** page in the AWS Systems Manager console. **Rerun**: This button allows you to run the same command without making changes to it. **Copy to new**: This button copies the settings of one command to a new command and gives you the option to edit those settings before you run it. For more information, see Rerunning commands.	February 5, 2020
Reverting from the advanced-instances tier to the standard-instances tier	If you previously configure d all on-premises instances running in your hybrid environment to use the advanced-instances tier, you can now quickly configure those instances to use the standard-instance tier. Reverting to the standard-instances tier applies to all hybrid instances in an AWS account and a single AWS Region. Reverting to the standard-instances tier impacts the availability of some Systems Manager tools. For more information, see Reverting from the advanced-instances tier to the standard-instances tier.	January 16, 2020

New option to skip instance reboots after patch installation	Previously, managed instances were always rebooted after Patch Manager installed patches on them. A new `RebootOption` parameter in the SSM document `AWS-RunPatchBaseline` allows you to specify whether or not you want your instances to reboot automatically after new patches are installed. For more information, see Parameter name: RebootOption in the topic About the SSM document `AWS-RunPatchBaseline`.	January 15, 2020
New topic: 'Running PowerShell scripts on Linux instances'	A new topic that describes how to use Run Command to run PowerShell scripts on Linux instances. For more information, see Running PowerShell scripts on Linux instances.	January 10, 2020
Updates to 'configure SSM Agent to use a proxy'	The values to specify when configuring SSM Agent to use a proxy have been updated to reflect options for both HTTP proxy servers and HTTPS proxy servers. For more information, see Configure SSM Agent to use a proxy.	January 9, 2020

New "Security" chapter outlines practices for securing Systems Manager resources	A new Security chapter in the *AWS Systems Manager User Guide* helps you understand how to apply the when using Systems Manager. Topics in the chapter show you how to configure Systems Manager to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Systems Manager resources. **Note** As part of this update, the user guide chapter "Authentication and Access Control" has been replaced by a new, simpler section, Identity and access management for AWS Systems Manager.	December 24, 2019

New sample custom Automation runbooks	A set of sample custom Automation runbooks has been added to the user guide. These samples show how to use various Automation actions to simplify deployment, troubleshooting, and maintenance tasks, and are intended to help you write your own custom Automation runbooks. For more information, see Custom Automation runbook samples. You can also view Amazon managed Automation runbook content in the Systems Manager console. For more information, see Systems Manager Automation Runbook Reference.	December 23, 2019
Support for the Oracle Linux	Systems Manager now supports Oracle Linux 7.5 and 7.7. For information about manually installing SSM Agent on EC2 instances for Oracle Linux instances, see Oracle Linux. For information about installing SSM Agent on Oracle Linux servers in a hybrid environment, see How to install the SSM Agent on hybrid Linux nodes.	December 19, 2019

Launch Session Manager sessions from the Amazon EC2 console	You can now start Session Manager sessions from the Amazon Elastic Compute Cloud (Amazon EC2) console. Working with session-related tasks from the Amazon EC2 console requires different IAM permissions for both users and administrators. You can provide permissions for using the Session Manager console and AWS CLI only, for using the Amazon EC2 console only, or for using all three tools. For more information, see the following topics. • Quickstart default IAM policies for Session Manager • Starting a session (Amazon EC2 console)	December 18, 2019

CloudWatch support for Run Command metrics and alarms	AWS Systems Manager now publishes metrics about the status of Run Command commands to CloudWatch, allowing you to set alarms based on those metrics. The terminal status values for commands for which you can track metrics include `Success`, `Failed`, and `Delivery Timed Out`. For more information, see Monitoring Run Command metrics using Amazon CloudWatch.	December 17, 2019
New Systems Manager tool: Change Calendar	Use Systems Manager Change Calendar to specify periods of time (events) during which you want to limit or prevent code changes (such as from Systems Manager Automation runbooks or AWS Lambda functions) to resources. A change calendar is a new Systems Manager document type that stores iCalendar 2.0 data in plaintext format. For more information, see AWS Systems Manager Change Calendar.	December 11, 2019

New Systems Manager tool: AWSAppConfig	Use AppConfig to create, manage, and quickly deploy application configurations. AppConfig supports controlled deployments to applications of any size. You can use AppConfig with applications hosted on EC2 instances, AWS Lambda, containers, mobile applications, or IoT devices. To prevent errors when deploying application configurations, AppConfig includes validators. A validator provides a syntactic or semantic check to ensure that the configuration you want to deploy works as intended. During a configuration deployment, AppConfig monitors the application to ensure that the deployment is successful. If the system encounters an error or if the deployment starts an alarm, AppConfig rolls back the change to minimize impact for your application users. For more information, see AWSAppConfig.	November 25, 2019

New Systems Manager tool: Systems Manager Explorer	AWS Systems Manager Explorer is a customizable operations dashboard that reports information about your AWS resources. Explorer displays an aggregated view of operations data (OpsData) for your AWS accounts and across AWS Regions. In Explorer, OpsData includes metadata about your EC2 instances, patch compliance details, and operational work items (OpsItems). Explorer provides context about how OpsItems are distributed across your business units or applications, how they trend over time, and how they vary by category. You can group and filter information in Explorer to focus on items that are relevant to you and that require action. When you identify high priority issues, you can use Systems Manager OpsCenter to run Automation runbooks and quickly resolve those issues. For information see, AWS Systems Manager Explorer. **Note** Set up for Systems Manager OpsCenter is integrated with	November 18, 2019

set up for Explorer. If you already set up OpsCenter, you still need to complete Integrated Setup to verify settings and options. If you haven't set up OpsCenter , then you can use Integrated Setup to get started with both tools. For more information, see Getting started with Explorer and OpsCenter.

Improved parameter search capabilities	The tools for searching for parameters now make it easier to find parameters when you have large number of them in your account or when you don't remember the exact name of a parameter . With the search tool, you filter by `contains`. Previously, the search tools supported searching for parameter names only by `equals` and `begins-with` . For more information, see Searching for Systems Manager parameters.	November 15, 2019

New console-based Document Builder for Automation | Support for running scripts in Automation steps	You can now use Systems Manager Automation to build and share standardized operational playbooks to ensure consistency across users, AWS accounts, and AWS Regions. With this ability to run scripts and add inline documentation to your Automation runbooks using Markdown, you can reduce errors and eliminate manual steps such as navigating written procedures in wikis and running terminal commands. For more information, see the following topics. • Walkthrough: Using Document Builder to create a custom Automation runbook • `aws:executeScript` (Automation actions reference) • Creating Automation runbooks using Document Builder • New Automation Features In Systems Manager on the *AWS News Blog*	November 14, 2019

Perform an in-place package update using Distributor	Previously, when you wanted to install an update to a package using Distribut or, your only choice was to uninstall the entire package and reinstall the new version. Now you can choose to perform an in-place update instead. During an in-place update, Distributor installs only files that are new or changed since the last installation, according to the *update script* you include in your package. With this option, your package applicati on can remain available and not be taken offline during the update. For more information, see the following topics. • Create a package • Install or update packages	November 11, 2019
New SSM Agent auto update feature	With one click, you can configure all instances in your AWS account to automatic ally check for and download new versions of SSM Agent. To do this, choose **Agent auto update** on the **Managed instances** page in the AWS Systems Manager console. For information, see Automate updates to SSM Agent.	November 5, 2019

Restrict Session Manager access using AWS-supplied tags	A second method for controlling user access to session actions is now available. With this new method, you create IAM access policies using AWS-supplied session tags instead of using the `{aws:username}` variable. Using these AWS-supplied session tags makes it possible for organizations that use federated IDs to control user access to sessions. For information, see Allow a user to terminate only sessions they started.	October 2, 2019

New SSM Command document to apply Ansible Playbooks	You can create State Manager associations that run Ansible Playbooks by using the `AWS-ApplyAnsiblePlaybooks` document. This document offers the following benefits for running Playbooks: • Support for running complex Playbooks • Support for downloading Playbooks from GitHub and Amazon Simple Storage Service (Amazon S3) • Support for compressed Playbook structure • Enhanced logging • Ability to specify which Playbook to run when Playbooks are bundled For more information, see Creating associations that run Ansible playbooks	September 24, 2019

Port forwarding support for Session Manager	Session Manager now supports port forwarding sessions. Port forwarding allows you to securely create tunnels between your instances deployed in private subnets, without the need to start the SSH service on the server, to open the SSH port in the security group, or to use a bastion host. Similar to SSH tunnels, port forwarding allows you to forward traffic between your laptop to open ports on your instance. Once port forwarding is configured, you can connect to the local port and access the server application running inside the instance. For more information, see the following topics: • Port Forwarding Using AWS Systems Manager Session Manager on the *AWS News Blog* • Starting a session (port forwarding)	August 29, 2019

Specify a default parameter tier or automate tier selection	You can now specify a default parameter tier to use for requests to create or update a parameter that don't specify a tier. You can set the default tier to standard parameters, advanced parameters, or a new option, Intelligent-Tiering. Intelligent-Tiering evaluates each PutParameter request and creates an advanced parameter only when required. (Advanced parameters are required if the size of the parameter value is more than 4 KB, a parameter policy is associated with the parameter, or the maximum 10,000 parameters supported for the standard tier are already created.) For more information about specifying a default tier and using Intelligent-Tiering, see Specifying a default parameter tier.	August 27, 2019
Working with associations section updated with CLI and PowerShell procedures	The Working with Associations section has been updated to include procedural documentation for managing associations using the AWS CLI or AWS Tools for PowerShell. For information see, Working with associations in Systems Manager.	August 26, 2019

Working with Automation executions section updated with CLI and PowerShell procedures	The Working with Automation Executions section has been updated to include procedural documentation for running Automation workflows using the AWS CLI or AWS Tools for PowerShell. For information see, Working with Automation executions.	August 20, 2019
OpsCenter integrates with application insights	OpsCenter integrates with Amazon CloudWatch Application Insights for .NET and SQL Server. This means you can automatically create OpsItems for problems detected in your applications. For information about how to configure Application Insights to create OpsItems, see Set up, configure, and manage your application for monitoring in the *Amazon CloudWatch User Guide*.	August 7, 2019

New console feature: AWS Systems Manager Quick Setup	Quick Setup is a new feature in the Systems Manager console that helps you quickly configure several Systems Manager components on your EC2 instances. Specifically, Quick Setup helps you configure the following components on the instances you choose or target by using tags: • An AWS Identity and Access Management (IAM) instance profile role for Systems Manager. • A scheduled, bi-monthly update of SSM Agent. • A scheduled collection of Inventory metadata every 30 minutes. • A daily scan of your instances to identify missing patches. • A one-time installation and configuration of the Amazon CloudWatch agent. • A scheduled, monthly update of the CloudWatch agent. For more information, see AWS Systems Manager Quick Setup.	August 7, 2019

Register a resource group as a maintenance window target	In addition to registering managed instances as the target of a maintenance window, you can now register a resource group as a maintenance window target. Maintenance Windows supports all the AWS resource types that are supported by AWS Resource Groups including `AWS::EC2::Instance`, `AWS::DynamoDB::Table`, `AWS::OpsWorks::Instance`, `AWS::Redshift::Cluster`, and more. With this release you can also send commands to a resource group, for example by using the Run Command console or the AWS CLI send-command command. For more information, see the following topics: • Assign targets to a maintenance window (console) • Examples: Register targets with a maintenance window • Using targets and rate controls to send commands to a fleet	July 23, 2019

Simplified package creation and versioning with AWS Systems Manager Distributor	Distributor has a new, simplified package creation workflow that can generate a package manifest, scripts, and file hashes for you. You can also use the simplifie d workflow when you add a version to an existing package.	July 22, 2019
New document categories pane for Systems Manager Automation	Systems Manager includes a new Document categorie s pane when you run an Automation in the console. Use this pane to filter Automation runbooks based on their purpose.	July 18, 2019
Support for starting Session Manager sessions using operating system user credentials	By default, Session Manager sessions are launched using the credentials of a system-generated `ssm-user` account that is created on a managed instance. On Linux machines, you can now instead launch sessions using the credentia ls of an operating system account. For information, see Turn on Run As support for Linux instances.	July 9, 2019

Support for starting Session Manager sessions using SSH	You can now use the AWS CLI to start an SSH session on a managed instance using Session Manager. For information about allowing SSH sessions with Session Manager, see (Optional) Turn on SSH Session Manager sessions. For information about starting an SSH session using Session Manager, see Starting a session (SSH).	July 9, 2019
Support for changing passwords on managed instances	You can now reset passwords on machines that you manage using Systems Manager (managed instances). You can reset the password using the Systems Manager console or the AWS CLI. For information, see Resetting passwords on managed instances.	July 9, 2019
Revisions to "What is AWS Systems Manager?"	The introductory content in What is AWS Systems Manager? has been expanded to provide a broader introduct ion to the service and reflect Systems Manager tools that have been released recently. In addition, other content in the section has been moved into individual topics for better discoverability.	June 10, 2019

New Systems Manager tool: OpsCenter	OpsCenter provides a central location where operations engineers and IT professionals can view, investigate, and resolve operational work items (OpsItems) related to AWS resources. OpsCenter is designed to reduce mean time to resolution for issues impacting AWS resources. This Systems Manager tool aggregates and standardizes OpsItems across services while providing contextual investigation data about each OpsItem, related OpsItems, and related resources. OpsCenter also provides Systems Manager Automation runbooks that you can use to quickly resolve issues. You can specify searchable, custom data for each OpsItem. You can also view automatically-generated summary reports about OpsItems by status and source. For more information, see AWS Systems Manager OpsCenter.	June 6, 2019

Changes to Systems Manager left navigation pane in the AWS Management Console	The Systems Manager left navigation pane in the AWS Management Console includes new headings, including a new heading for Ops Center, that provide a more logical grouping of Systems Manager tools.	June 6, 2019

Revised tutorial for creating and configuring a maintenance window using the AWS CLI	Tutorial: Create and configure a maintenance window (AWS CLI) has been overhauled to provide a simple path through the practice steps. You create a single maintenance window, identify a single target, and set up a simple task for the maintenance window to run. Along the way, we provide information and examples you can use to create your own task registration commands, including information for using pseudo parameters such as `{{TARGET_ID}}` . For additional information and examples, see the following topics: • Examples: Register targets with a maintenance window • Examples: Register tasks with a maintenance window • About register-task-with-maintenance-windows options • Using pseudo parameters when registering maintenance window tasks	May 31, 2019
Notifications about SSM Agent updates	To be notified about SSM Agent updates, subscribe to the SSM Agent Release Notes page on GitHub.	May 24, 2019

Receive notifications or trigger actions based on changes in Parameter Store	The topic Set up notifications or trigger actions based on Parameter Store events now helps you set up Amazon EventBridge rules to respond to changes in Parameter Store. You can receive notifications or trigger other actions when any of the following occur: • A parameter is created, updated, or deleted. • A parameter label version is created, updated, or deleted. • A parameter expires, is going to expire, or hasn't changed in a specified period of time.	May 22, 2019

Major revisions to setting up and getting started content	We have expanded and reorganized the *Setting Up* and *Getting Started* content in the *AWS Systems Manager User Guide*. *Setting Up* content has been divided into two sections. One section focuses on tasks for setting up Systems Manager to configure and manage your EC2 instances. The other focuses on tasks for setting up Systems Manager to configure and manage your on-premises servers and virtual machines (VMs) in a hybrid environment. Both sections now present all setup topics as major numbered steps, in the recommend ed order of completion. A new *Getting Started* chapter focuses on helping end-users get started with Systems Manager after account and service configuration tasks have been completed. • Setting up AWS Systems Manager • Setting up AWS Systems Manager for hybrid environments • Getting started with AWS Systems Manager	May 15, 2019

Include patches for applications released by Microsoft in patch baselines (Windows)	Patch Manager now supports patch updates for applications released by Microsoft on Windows Server instances. Previously, only patches for the Windows Server operating system were supported. Patch Manager provides two predefined patch baselines for Windows Server instances. The patch baseline `AWS-WindowsPredefinedPatchBaseline-OS` applies to operating system patches only. `AWS-WindowsPredefinedPatchBaseline-OS-Applications` applies to both the Windows Server operating system and applications released by Microsoft on Windows. For information about creating a custom patch baseline that includes patches for applications released by Microsoft, see the first procedure in Create a custom patch baseline. Also, as part of this update, the names of AWS-provided predefined patch baselines are being changed. For more information, see Predefined baselines.	May 7, 2019

Examples for registering maintenance window targets using the AWS CLI	The new topic Examples: Register targets with a maintenance window provides three sample commands to demonstra te different ways you can specify the targets for a maintenance window when you use the AWS CLI. The topic also explains the best use case for each of the sample commands.	May 3, 2019
Updates to patch group topics	The topic About patch groups has been updated to include a section on how managed instances determine the appropriate patch baseline to use during patching operation s. Additionally, instructions have been added for using the AWS CLI or Systems Manager console to add **Patch Group** or **PatchGrou p** tags to your managed instances, and how to add a **Patch Group** or **PatchGrou p** to a patch baseline. (You must use **`PatchGroup`** , without a space, if you have allowed tags in EC2 instance metadata.) For more information see Create a patch group and Add a patch group to a patch baseline.	May 1, 2019

New Parameter Store features	Parameter Store offers the following new features: • **Advanced parameters:** Parameter Store now allows you to individually configure parameters to use either a standard-parameter tier (the default tier) or an advanced-parameter tier. Advanced parameters offer a larger size quota for the parameter value, a higher quota for the number of parameters you can create per AWS account and AWS Region, and the ability to use parameter policies. For more information about advanced parameters, see About Systems Manager advanced parameters. • **Parameter policies:** Parameter policies help you manage a growing set of parameters by allowing you to assign specific criteria to a parameter, such as an expiration date or *time to live*. Parameter policies are especially helpful in forcing you to update or delete passwords and configuration data stored in Parameter Store. Parameter	April 25, 2019

	policies are only available for parameters that use the advanced-parameter tier. For more information, see Working with parameter policies. • **Higher throughput:** You can now increase the Parameter Store throughput quota to a maximum of 1,000 transactions per second. For more information, see Increasing Parameter Store throughput.	
Updates to the Automation section	The Automation section has been updated for improved discoverability. In addition, three new topics have been added to the Automation section: • Run an automation step by step • Run an automation that requires approvals • Scheduling automations with State Manager associations	April 17, 2019

Encrypt session data using an AWS KMS key	By default, Session Manager uses TLS 1.2 to encrypt session data transmitted between the local machines of users in your account and your EC2 instances. Now you can choose to further encrypt that data using an AWS KMS key that has been created in AWS Key Management Service. You can use a KMS key that has been created in your AWS account or one that has been shared with you from another account. For information about specifying a KMS key to encrypt session data, see Turn on AWS KMS key encryption of session data (console), Create Session Manager preferences (AWS CLI), or Update Session Manager preferences (AWS CLI).	April 4, 2019
Configuring Amazon SNS notifications for AWS Systems Manager	Added instructions for using the AWS CLI or Systems Manager console to configure Amazon SNS notifications for Run Command and Run Command tasks registered to a maintenance window. For more information see Configuring Amazon SNS notifications for AWS Systems Manager.	March 6, 2019

Advanced instances for servers and VMs in hybrid environments	AWS Systems Manager offers a standard-instances tier and an advanced-instances tier for servers and VMs in your hybrid environment. The standard-instances tier allows you to register a maximum of 1,000 servers or VMs per AWS account per AWS Region. If you need to register more than 1,000 servers or VMs in a single account and Region, then use the advanced-instances tier. You can create as many instances as you like in the advanced-instances tier, but all instances configure d for Systems Manager are available on a pay-per-use basis. Advanced instances also allow you to connect to your hybrid machines by using AWS Systems Manager Session Manager. Session Manager provides interactive shell access to your instances . For more information about allowing advanced instances , see Using the advanced-instances tier.	March 4, 2019

Create State Manager associations that use shared SSM documents	You can create State Manager associations that use SSM Command and Automatio n runbooks shared from other AWS accounts. Creating associations by using shared SSM documents helps to keep your Amazon EC2 and hybrid infrastructure in a consisten t state even when instances aren't in the same account. For information about sharing SSM documents, see AWS Systems Manager Documents . For information about creating a State Manager association, see Create an association.	February 28, 2019
View lists of Systems Manager events supported for Amazon EventBridge rules	The new topic Monitoring Systems Manager events with Amazon EventBridge provides a summary of the various events emitted by Systems Manager for which you can set up event monitoring rules in EventBridge.	February 25, 2019

Add tags when you create Systems Manager resources	Systems Manager now supports the ability to add tags to certain resource types when you create them. The resources you can tag when you create them with the AWS CLI or an SDK include maintenance windows, patch baselines, Parameter Store parameters, and SSM documents. You can also assign tags to a managed instance when you create an activation for it. When you use the Systems Manager console, you can add tags to maintenance windows, patch baselines, and parameters.	February 24, 2019

Automatic IAM role creation for Systems Manager Inventory	Previously you had to create an AWS Identity and Access Management (IAM) role and attach separate policies to this role to view inventory data on the **Inventory Detail View** page in the console. You no longer need to create this role or attach policies to it. When you choose a Remote Data Sync on the **Inventory Detail View** page, Systems Manager automatically creates the `Amazon-GlueService PolicyForSSM` role and assigns the **Amazon-GlueServicePolicyForSSM-{*S3 bucket name*}** policy and the **AWSGlueServiceRole** policy to it. For more information, see Querying inventory data from multiple Regions and accounts.	February 14, 2019
Maintenance Windows walkthroughs to update SSM Agent	Added two new walkthroughs to the Maintenance Windows documentation. The walkthroughs detail how to use the Systems Manager console or the AWS CLI to create a maintenance window that keeps SSM Agent up-to-date automatically. For more information, see Maintenance Windows walkthroughs.	February 11, 2019

Using Parameter Store public parameters	Added short section describing Parameter Store public parameters. For more information, see Using Systems Manager public parameters.	January 31, 2019
Use the AWS CLI to create Session Manager preferences	Added instructions for using the AWS CLI to create Session Manager preferences, such as CloudWatch Logs, S3 bucket logging options, and session encryption settings. For more information, see Use the AWS CLI to create Session Manager preferences.	January 22, 2019
Executing Systems Manager automation workflows by using State Manager	AWS Systems Manager State Manager now supports creating associations that use SSM Automation runbooks. State Manager previously supported only `command` and `policy` documents , which meant that you could only create associations that targeted managed instances. With support for SSM Automation runbooks, you can now create associations that target different types of AWS resources. For more information, see Executing Systems Manager Automation workflows by using State Manager.	January 22, 2019

Reference updates for cron and rate expressions and maintenance window scheduling options	The reference topic Cron and rate expressions for Systems Manager has been revised. The new version provides more examples and improved explanations of how to use cron and rate expressions to schedule your maintenance windows and State Manager associations. In addition, the new topic Maintenance Windows scheduling and active period options explains how the various schedule-related options for maintenance windows (Start date, End date, Time zone, Schedule frequency) relate to one another.	December 6, 2018
Turn on SSM Agent debug logging	You can turn on SSM Agent debug logging by editing the seelog.xml.template file on the managed instance. For more information, see Turn on SSM Agent debug logging.	November 30, 2018

Support for ARM64 processor architectures	AWS Systems Manager now supports ARM64 versions of the Amazon Linux 2, Red Hat Enterprise Linux 7.6, and Ubuntu Server (18.04 LTS and 16.04 LTS) operating systems. For more information, see the instructions for installing Amazon Linux 2, RHEL, and Ubuntu Server 18.04 and 16.04 LTS with Snap packages. For more information about the A1 instance type, see General purpose instances in the *Amazon EC2 User Guide*.	November 26, 2018

Create and deploy packages by using AWS Systems Manager Distributor	Using AWS Systems Manager Distributor, you package your own software—or find AWS-provided agent software packages, such as `AmazonCloudWatchAgent` —to install on AWS Systems Manager managed instances. Distributor publishes resources, such as software packages, to AWS Systems Manager managed instances. Publishing a package advertises specific versions of the package's document—a Systems Manager document that you create when you add the package in Distributor—to managed instances that you identify by managed instance IDs, AWS account IDs, tags, or an AWS Region. For more information, see AWS Systems ManagerDistributor.	November 20, 2018

Concurrently run AWS Systems Manager Automation workflows across multiple AWS Regions and AWS accounts from a central account	You can concurrently run AWS Systems Manager automation workflows across multiple AWS Regions and AWS accounts or AWS Organizational Units (OUs) from an Automation management account. Concurrently executing Automations in multiple Regions and accounts or OUs reduces the time required to administer your AWS resources while enhancing the security of your computing environment. For more information see Executing Automation workflows in multiple AWS Regions and AWS accounts.	November 19, 2018
Query inventory data from multiple AWS Regions and AWS accounts	Systems Manager Inventory integrates with Amazon Athena to help you query inventory data from multiple AWS Regions and AWS accounts. Athena integration uses resource data sync so that you can view inventory data from all of your managed instances on the **Inventory Detail View** page in the AWS Systems Manager console. For more information see Querying Inventory data from multiple Regions and accounts.	November 15, 2018

Create State Manager associations that run MOF files	You can run Managed Object Format (MOF) files to enforce a targeted state on Windows Server managed instances with State Manager by using the `AWS-ApplyDSCMofs` SSM document. The `AWS-ApplyDSCMofs` document has two execution modes. With the first mode, you can configure the associati on to scan and report if the managed instances are currently in the targeted state defined in the specified MOF files. In the second mode, you can run the MOF files and change the configuration of your instances based on the resources and their values defined in the MOF files. The `AWS-ApplyDSCMofs` document allows you to download and run MOF configuration files from Amazon Simple Storage Service (Amazon S3), a local share, or from a secure web site with an HTTPS domain. For more information, see Creating associations that run MOF files.	November 15, 2018

Restrict administrative access in Session Manager sessions	Session Manager sessions are launched using the credentials of a user account that is created with default root or administrator permissions called `ssm-user`. Information about restricting administrative control for this account is now available in the topic Turn on or turn off ssm-user account administrative permissions.	November 13, 2018
YAML examples in Automation actions reference	The Automations actions reference now includes a YAML sample for each action that already includes a JSON sample.	October 31, 2018
Assign compliance severity levels to associations	You can now assign compliance severity levels to State Manager associations. These severity levels are reported in the Compliance Dashboard and can also be used to filter your compliance reports. The severity levels you can assign include Critical, High, Medium, Low, and Unspecified. For more information, see Create an association (console).	October 26, 2018

Use targets and rate controls with Automation and State Manager	Control the execution of Automations and State Manager associations across your fleet of resources by using targets, concurrency, and error thresholds. For more information see Using targets and rate controls to run Automation workflows on a fleet and Using targets and rate controls with State Manager associations.	October 23, 2018
Specify active time ranges and international time zones for maintenance windows	You can also specify dates that a maintenance window shouldn't run before or after (start date and end date), and you can specify the international time zone on which to base the maintenance window schedule. For more information see Create a maintenance window (console) and Update a maintenance window (AWS CLI).	October 9, 2018

Maintain a custom list of patches for your patch baseline in an S3 bucket	With the new 'InstallOverrideList' parameter in the SSM command document `AWS-RunPatchBaseline`, you can specify an https URL or an Amazon Simple Storage Service (Amazon S3) path-style URL to a list of patches to be installed. This patch installation list, which you maintain in an S3 bucket in YAML format, overrides the patches specified by the default patch baseline. For more information, see Parameter name: InstallOverrideList.	October 5, 2018
Expanded control over whether patch dependencies are installed	Previously, if a patch in your Rejected patches list was identified as a dependency of another patch, it would still be installed. Now you can choose whether to install these dependencies or block them from being installed. For more information, see Create a patch baseline.	October 5, 2018

Create dynamic automation workflows with conditional branching	The `aws:branch` Automation action allows you to create a dynamic Automation workflow that evaluates multiple choices in a single step and then jumps to a different step in the Automation runbook based on the results of that evaluation. For more information, see Using conditional statements in runbooks.	September 26, 2018
Use the AWS CLI to update Session Manager preferences	Instructions for using the CLI to update Session Manager preferences, such as CloudWatch Logs and S3 bucket logging options, have been added to the *AWS Systems Manager User Guide*. For information, see Use the AWS CLI to update Session Manager preferences.	September 25, 2018
Updated SSM Agent requirement for Session Manager	Session Manager now requires SSM Agent version 2.3.68.0 or later. For more information about Session Manager prerequisites, see Complete Session Manager prerequisites.	September 17, 2018

Manage instances without opening inbound ports or maintaining bastion hosts using Session Manager	Using Session Manager, a fully managed tool in AWS Systems Manager, you can manage your EC2 instances through an interactive one-click browser-based shell or through the AWS CLI. Session Manager provides secure and auditable instance management without the need to open inbound ports, maintain bastion hosts, or manage SSH keys. Session Manager also allows you to comply with corporate policies that require controlled access to instances, strict security practices, and fully auditable logs with instance access details, while still providing end users with simple one-click cross-platform access to your EC2 instances. For more information, see Learn more about Session Manager.	September 11, 2018

Invoking other AWS services from a Systems Manager Automation workflow	You can invoke other AWS services and other Systems Manager tools in your Automation workflow by using three new Automatio n actions (or plugins) in your Automation runbooks. For more information, see For more information, see Using action outputs as inputs.	August 28, 2018
Use Systems Manager-specific condition keys in IAM policies	The topic Specifying conditions in a policy has been updated to list the IAM condition keys for Systems Manager that you can incorporate in policies. You can use these keys to specify the conditions under which a policy should take effect. The topic also includes links to example policies and other related topics.	August 18, 2018
Aggregate inventory data with groups to see which instances are and aren't configured to collect an inventory type	Groups allow you to quickly see a count of which managed instances are and aren’t configured to collect one or more Inventory types. With groups, you specify one or more Inventory types and a filter that uses the `exists` operator. For more informati on, see Aggregating Inventory data.	August 16, 2018

View history and change tracking for Inventory and Configuration Compliance	You can now view history and change tracking for Inventory collected from your managed instances. You can also viewing history and changing tracking for Patch Manager patching and State Manager associations reported by Configuration Compliance. For more information, see Viewing Inventory history and change tracking.	August 9, 2018

Parameter Store integrates with Secrets Manager	Parameter Store is now integrated with AWS Secrets Manager so that you can retrieve Secrets Manager secrets when using other AWS services that already support references to Parameter Store parameters. These services include Amazon EC2, Amazon Elastic Container Service, AWS Lambda, CloudFormation, AWS CodeBuild, AWS CodeDeploy, and other Systems Manager tools. By using Parameter Store to reference Secrets Manager secrets, you create a consistent and secure process for calling and using secrets and reference data in your code and configuration scripts. For information, see Referencing AWS Secrets Manager secrets from Parameter Store parameters.	July 26, 2018

Attach labels to Parameter Store parameters	A parameter label is a user-defined alias to help you manage different versions of a parameter. When you modify a parameter, Systems Manager automatically saves a new version and increments the version number by one. A label can help you remember the purpose of a parameter version when there are multiple versions. For information, see Labeling parameters.	July 26, 2018
Create dynamic Automation workflows	By default, the steps (or actions) that you define in the mainSteps section of an Automation runbook run in sequential order. After one action is complete, the next action specified in the mainSteps section begins. With this release, you can now create Automation workflows that perform *conditional branching*. This means that you can create Automation workflows that dynamically respond to condition changes and jump to a specified step. For information, see Using conditional statements in runbooks.	July 18, 2018

SSM Agent now pre-installed on Ubuntu Server 16.04 AMIs using Snap	Beginning with instances created from Ubuntu Server 16.04 AMIs identified with `20180627`, the SSM Agent is pre-installed using Snap packages. On instances created from earlier AMIs, you should continue using deb installer packages. For information, see About SSM Agent installations on 64-bit Ubuntu Server 16.04 instances.	July 7, 2018
Review minimum S3 permissions required by SSM Agent	The new topic Minimum S3 bucket permissions for SSM Agent provides information about the Amazon Simple Storage Service (Amazon S3) buckets that resources might need to access to perform Systems Manager operations. You can specify these buckets in a custom policy if you want to limit S3 bucket access for an instance profile or VPC endpoint to the minimum required to use Systems Manager.	July 5, 2018
View complete execution history for a specific State Manager association ID	The new topic Viewing association histories describes how to view all executions for a specific association ID and then view execution details for one or more resources.	July 2, 2018

Patch Manager introduces support for Amazon Linux 2	You can now use Patch Manager to apply patches to Amazon Linux 2 instances . For general informati on about Patch Manager operating system support, see Patch Manager prerequis ites. For information about the supported key-value pairs for Amazon Linux 2 when defining a patch filter, see PatchFilter in the *AWS Systems Manager API Reference*.	June 26, 2018
Send command output to Amazon CloudWatch Logs	The new topic Configuring Amazon CloudWatch Logs for Run Command describes how to send Run Command output to CloudWatch Logs.	June 18, 2018

Quickly create or delete resource data sync for Inventory by using CloudFormation	You can use CloudFormation to create or delete a resource data sync for Systems Manager Inventory. To use CloudFormation, add the AWS::SSM::ResourceDataSync resource to your CloudFormation template. For more information, see Working with AWS CloudFormation Templates in the *AWS CloudFormation User Guide*. You can also manually create a resource data sync for Inventory as described in Creating a resource data sync for Inventory.	June 11, 2018
AWS Systems Manager User Guide update notifications now available through RSS	The HTML version of the Systems Manager User Guide now supports an RSS feed of updates that are documented in the Systems Manager Documentation update history page. The RSS feed includes updates made in June, 2018, and later. Previously announced updates are still available in the **Systems Manager documentation update history** page. Use the RSS button in the top menu panel to subscribe to the feed.	June 6, 2018

Specify an exit code in scripts to reboot managed instances	The new topic Rebooting managed instances from scripts describes how to instruct Systems Manager to reboot managed instances by specifying an exit code in scripts that you run with Run Command.	June 3, 2018
Create an event in Amazon EventBridge whenever custom inventory is deleted	The new topic Viewing inventory delete actions in EventBridge describes how to configure Amazon EventBridge to create an event anytime a user deletes custom Inventory.	June 1, 2018

Updates prior to June 2018

The following table describes important changes in each release of the *AWS Systems Manager User Guide* before June 2018.

Change	Description	Release date
Inventory all managed instances in your AWS account	You can inventory all managed instances in your AWS account by creating a global inventory association. For more information, see Inventory all managed nodes in your AWS account. **Note** Global inventory associations are available in SSM Agent version 2.0.790.0 or later. For informati on about how to update SSM Agent on your	May 3, 2018

Change	Description	Release date
	instances, see Updating the SSM Agent using Run Command.	
SSM Agent installed by default on Ubuntu Server 18	SSM Agent is installed, by default, on Ubuntu Server 18.04 LTS 64-bit and 32-bit AMIs.	May 2, 2018
New topic	The new topic Running commands using a specific document version describes how to use the document-version parameter to specify which version of an SSM document to use when the command runs.	May 1, 2018
New topic	The new topic Deleting custom inventory describes how to delete custom Inventory data from Amazon S3 by using the AWS CLI. The topic also describes how to use the `SchemaDeleteOption` to manage custom inventory by turning off or deleting a custom inventory type. This new feature uses the DeleteInventory API operation.	April 19, 2018
Amazon SNS notifications for SSM Agent	You can subscribe to an Amazon SNS topic to receive notifications when a new version of SSM Agent is available. For more information, see Subscribing to SSM Agent notifications.	April 9, 2018
CentOS patching support	Systems Manager now supports patching CentOS instances. For information about supported CentOS versions, see Patch Manager prerequisites. For more information about how patching works, see How Patch Manager operations work.	March 29, 2018

Change	Description	Release date
New section	To provide a single source for reference information in the AWS Systems Manager User Guide, a new section has been introduced, AWS Systems Manager reference . Additional content will be added to this section as it becomes available.	March 15, 2018
New topic	The new topic Package name formats for approved and rejected patch lists details the package name formats you can enter in the lists of approved patches and rejected patches for a custom patch baseline. Sample formats are provided for each operating system type supported by Patch Manager.	March 9, 2018
New topic	Systems Manager now integrates with ChefChef InSpec. InSpec is an open-source, runtime framework that allows you to create human-readable profiles on GitHub or Amazon S3. Then you can use Systems Manager to run compliance scans and view compliant and noncompliant instances. For more information, see Using Chef InSpec profiles with Systems Manager Compliance.	March 7, 2018
New topic	The new topic Using service-linked roles for Systems Manager describes how to use an AWS Identity and Access Management (IAM) service-linked role with Systems Manager. Currently, service-linked roles are only required when using Systems Manager Inventory to collect metadata about tags and Resource Groups.	February 27, 2018

Change	Description	Release date
New and updated topics	You can now use Patch Manager to install patches that are in a different source repository than the default one configured on the instance. This is useful for patching instances with updates not related to security; with the content of Personal Package Archives (PPA) for Ubuntu Server; with updates for internal corporate applications; and so on. You specify alternative patch source repositor ies when you create a custom patch baseline. For more information, see the following topics: • How to specify an alternative patch source repository (Linux) • Working with custom patch baselines • Create a patch baseline with custom repositories for different OS versions	February 6, 2018
New topic	The new topic SSM Command documents for patching managed nodes describes the seven SSM documents available to help you keep your managed instances patched with the latest security-related updates.	January 10, 2018
Important updates regarding Linux support	Updated various topics with the following information: • SSM Agent is installed, by default, on Amazon Linux 1 *base* AMIs dated 2017.09 and later. • Manually install SSM Agent on other versions of Linux, including non-base images like *Amazon ECS-Optimized AMIs*.	January 9, 2018

Change	Description	Release date
New topic	A new topic, SSM Command document for patching: `AWS-RunPatchBaseline`, provides details of how this SSM document operates on both Windows and Linux systems. It also provides information about the two available parameters in the `AWS-RunPatchBaseline` document, `Operation` and `Snapshot ID`.	January 5, 2018
New topics	A new section, How Patch Manager operations work, provides technical details that explain how Patch Manager determines which security patches to install and how it installs them on each supported operating system. It also provides information about how patch baseline rules work on different distributions of the Linux operating system	January 2, 2018
Retitled and moved the Systems Manager Automation Actions Reference	Based on customer feedback, the Automation actions reference is now called the Systems Manager Automation Runbook Reference. Furthermore, we moved the reference into the Shared Resources > Documents node so it is closer to the Command document plugin reference. For more information, see Systems Manager Automation actions reference.	December 20, 2017
New Monitoring chapter and content	A new chapter, Logging and monitoring in AWS Systems Manager, provides instructions for sending metrics and log data to Amazon CloudWatch Logs. A new topic, Sending node logs to unified CloudWatch Logs (CloudWatch agent), provides instructions for migrating on-instance monitoring tasks, on 64-bit Windows Server instances only, from SSM Agent to the CloudWatch agent.	December 14, 2017

Change	Description	Release date
New chapter	A new chapter, Identity and access management for AWS Systems Manager, provides comprehensive informati on about using AWS Identity and Access Management (IAM) and AWS Systems Manager to help secure access to your resources through the use of credentials. These credentials provide the permissions required to access AWS resources, such as accessing data stored in S3 buckets and sending commands to and reading the tags on EC2 instances.	December 11, 2017
Changes to the left navigation	We changed the headings in the left navigation of this user guide to match the headings in the new AWS Systems Manager console.	December 8, 2017
Multiple changes for re:Invent 2017	• **Official launch of AWS Systems Manager**: AWS Systems Manager (formerly Amazon EC2 Systems Manager) is a unified interface that allows you to centralize operational data and automate tasks across your AWS resources. You can access the new AWS Systems Manager console here. For more information, see What is AWS Systems Manager? • **YAML Support**: You can create SSM documents in YAML. For more information, see AWS Systems Manager Documents.	November 29, 2017

Change	Description	Release date
Using Run Command to Take VSS-Enabled Snapshots of EBS Volumes	Using Run Command, you can take application-consistent snapshots of all Amazon Elastic Block Store (Amazon EBS) volumes attached to your Amazon EC2 Windows instances. The snapshot process uses the Windows Volume Shadow Copy Service (VSS) to take image-level backups of VSS-aware applications, including data from pending transactions between these applications and the disk. Furthermore, you don't need to shut down your instances or disconnect them when you need to back up all attached volumes. For more information, see Take Microsoft VSS-Enabled Snapshots Using AWS Systems Manager in the *Amazon EC2 User Guide*.	November 20, 2017
Enhanced Systems Manager Security Available By Using VPC Endpoints	You can improve the security posture of your managed instances (including managed instances in your hybrid environment) by configuring Systems Manager to use an interface VPC endpoint. Interface endpoints are powered by PrivateLink, a technology that allows you to privately access Amazon EC2 and Systems Manager APIs by using private IP addresses. PrivateLink restricts all network traffic between your managed instances, Systems Manager, and EC2 to the Amazon network (managed instances don't have access to the Internet). Also, you don't need an Internet gateway, a NAT device, or a virtual private gateway. For more information, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager.	November 7, 2017

Change	Description	Release date
Inventory Support for Files, Services, Windows Roles, and the Windows Registry	SSM Inventory now supports gathering the following information from your managed instances. • **Files**: Name, size, version, installed date, modification and last accessed times, and so on. • **Services**: Name, display name, status, dependent services, service type, start type, and so on. • **Windows Registry**: Registry key path, value name, value type, and value. • **Windows roles**: Name, display name, path, feature type, installed state, and so on. Before you attempt to collect information for these inventory types, update SSM Agent on the instances you want to inventory. By running the latest version of SSM Agent, you ensure that you can collect metadata for all supported inventory types. For information about how to update SSM Agent by using State Manager, see Walkthrough: Automatically update SSM Agent with the AWS CLI. For more information Inventory, see Learn more about Systems Manager Inventory.	November 6, 2017
Updates to Automation documentation	Fixed several issues in the information about setting up and configuring access for Systems Manager Automation. For more information, see Setting up Automation.	October 31, 2017

Change	Description	Release date
GitHub and Amazon S3 Integration	**Run remote scripts**: Systems Manager now supports downloading and running scripts from a private or public GitHub repository, and from Amazon S3. Using either the `AWS-RunRemoteScript` pre-defined SSM document or the `aws:downloadContent` plugin in a custom SSM document, you can run Ansible Playbooks and scripts in Python, Ruby, or PowerShell, to name a few. These changes further enhance *infrastructure as code* when you use Systems Manager to automate configuration and deployment of EC2 instances and on-premises managed instances in your hybrid environment. For more informati on, see Running scripts from GitHub and Running scripts from Amazon S3. **Create composite SSM documents**: Systems Manager now supports running one or more secondary SSM documents from a primary SSM document. These primary documents that run other documents are called *composite* documents. Composite documents allow you to create and share a standard set of secondary SSM documents across AWS accounts for common tasks such as boot-stra pping anti-virus software or domain-joining instances. You can run composite and secondary documents stored in Systems Manager, GitHub, or Amazon S3. After you create a composite document, you can run it by using the `AWS-RunDocument` pre-defined SSM document. For more information, see Creating composite documents and Running documents from remote locations. **SSM document plugin reference**: For easier access, we moved the SSM Plugin Reference for SSM documents out of the Systems Manager API Reference and into the User Guide. For more information, see Command document plugin reference.	October 26, 2017

Change	Description	Release date
Support for Parameter Versions in Parameter Store	When you edit a parameter, Parameter Store now automatically iterates the version number by 1. You can specify a parameter name and a specific version number in API calls and SSM documents. If you don't specify a version number, the system automatically uses the latest version. Parameter versions provide a layer of protection in the event that a parameter is accidentally changed. You can view the values of all versions, and reference older versions if necessary. You can also use parameter versions to see how many times a parameter changed over a period of time. For more information, see Working with parameter versions in Parameter Store.	October 24, 2017
Support for Tagging Systems Manager Documents	You can now use the AddTagsToResource API, the AWS CLI, or the AWS Tools for PowerShell to tag Systems Manager documents with key-value pairs. Tagging helps you quickly identify specific resources based on the tags you've assigned to them. This is in addition to existing tagging support for managed instances, maintenan ce windows, Parameter Store parameters, and patch baselines.	October 3, 2017

Change	Description	Release date
Various Documentation Updates to Fix Errors or Update Content Based on Feedback	• Updated Managing nodes in hybrid and multicloud environments with Systems Manager with information for Raspbian Linux. • Updated Managing EC2 instances with Systems Manager with new requirement for Windows Server instances. SSM Agent requires Windows PowerShell 3.0 or later to run certain SSM Documents on Windows Server instances (for example, the legacy `AWS-ApplyPatchBaseline` SSM document). Verify that your Windows Server instances are running Windows Management Framework 3.0 or later. The framework includes PowerShell. For more information, see Windows Management Framework 3.0.	October 2, 2017
Troubleshoot Unreachable Windows Instances by Using the EC2Rescue Automation Workflow	EC2Rescue can help you diagnose and troubleshoot problems on Amazon EC2 Windows Server instances. You can run the tool as a Systems Manager Automation workflow by using the **AWSSupport-ExecuteEC2Rescue** document. The **AWSSupport-ExecuteEC2Rescue** document is designed to perform a combination of Systems Manager actions, CloudFormation actions, and Lambda functions that automate the steps normally required to use EC2Rescue. For more information, see Run the EC2Rescue tool on unreachable instances.	September 29, 2017
SSM Agent Installed By Default on Amazon Linux	SSM Agent is installed, by default, on Amazon Linux AMIs dated 2017.09 and later. Manually install SSM Agent on other versions of Linux, as described in Working with SSM Agent on EC2 instances for Linux.	September 27, 2017

Change	Description	Release date
Run Command Enhancements	Run Command includes the following enhancements. • You can restrict command execution to specific instances by creating and assigning an IAM policy that includes a condition that the user can only run commands on instances that are tagged with specific Amazon EC2 tags. For more information, see Restricting Run Command access based on tags. • You have more options for targeting instances by using Amazon EC2 tags. You can now specify multiple tag keys and multiple tag values when sending commands. For more information, see Run commands at scale.	September 12, 2017
Systems Manager Supported on Raspbian	Systems Manager can now run on Raspbian Jessie and Raspbian Stretch devices, including Raspberry Pi (32-Bit).	September 7, 2017
Automatically Send SSM Agent Logs to Amazon CloudWatch Logs	You can now make a simple configuration change on your instances to have SSM Agent send log files to CloudWatch. For more information, see Sending SSM Agent logs to CloudWatch Logs.	September 7, 2017
Encrypt resource data sync	With Systems Manager resource data sync, you can aggregate Inventory data collected on dozens or hundreds of managed instance in a central S3 bucket. You can now encrypt resource data sync by using an AWS Key Management Service key. For more information, see Walkthrough: Using resource data sync to aggregate inventory data.	September 1, 2017

Change	Description	Release date
New State Manager Walkthroughs	Added two new walkthroughs to the State Manager documentation: Walkthrough: Automatically update SSM Agent with the AWS CLI Walkthrough: Automatically update PV drivers on EC2 instances for Windows Server	August 31, 2017
Systems Manager Configuration Compliance	Use Configuration Compliance to scan your fleet of managed instances for patch compliance and configuration inconsistencies. You can collect and aggregate data from multiple AWS accounts and AWS Regions, and then drill down into specific resources that aren't compliant. By default, Configuration Compliance displays compliance data about Patch Manager patching and State Manager associations. You can also customize the service and create your own compliance types based on your IT or business requirements. For more information, see AWS Systems Manager Compliance.	August 28, 2017
New Automation Action: `aws:executeAutomation`	Runs a secondary Automation workflow by calling a secondary Automation runbook. With this action, you can create Automation runbooks for your most common workflows, and reference those documents during an Automation execution. This action can simplify your Automation runbooks by removing the need to duplicate steps across similar runbooks. For more information, see `aws:executeAutomation` – Run another automation.	August 22, 2017

Change	Description	Release date
Automation as the Target of a CloudWatch Event	You can start an Automation workflow by specifying an Automation runbook as the target of an Amazon CloudWatch event. You can start workflows according to a schedule, or when a specific AWS system event occurs. For more information, see Run automations based on EventBridge events.	August 21, 2017
State Manager Association Versioning and General Updates	You can now create different State Manager associati on versions. There is a quota of 1,000 versions for each association. You can also specify names for your associations. Also, the State Manager documentation has been updated to address outdated information and inconsistencies. For more information, see AWS Systems Manager State Manager.	August 21, 2017

Change	Description	Release date
Changes to Maintenance Windows	Maintenance Windows include the following changes or enhancements: • Previously, Maintenance Windows could only perform tasks by using Run Command. You can now perform tasks by using Systems Manager Automation, AWS Lambda, and AWS Step Functions. • You can edit the targets of a maintenance window, specify a target name, description, and owner. • You can edit tasks in a maintenance window, including specifying a new SSM document for Run Command and Automation tasks. • All Run Command parameters are now supported , including DocumentHash, DocumentHashType, TimeoutSeconds, Comment, and NotificationConfig. • You can now use a `safe` flag when you attempt to deregister a target. If turned on, the system returns an error if the target is referenced by any task. For more information, see AWS Systems Manager Maintenance Windows.	August 16, 2017
New Automation Action: `aws:approve`	This new action for Automation runbooks temporarily pauses an Automation execution until designated principals either approve or reject the action. After the required number of approvals is reached, the Automation execution resumes. For more information, see Systems Manager Automation actions reference.	August 10, 2017

Change	Description	Release date
Automation assume role no longer required	Automation previously required that you specify a service role (or *assume role*) so that the service had permission to perform actions on your behalf. Automation no longer requires this role because the service now operates by using the context of the user who invoked the execution. However, the following situations still require that you specify a service role for Automation: • When you want to restrict a user's permissions on a resource, but you want the user to run an Automatio n workflow that requires elevated permissions. In this scenario, you can create a service role with elevated permissions and allow the user to run the workflow. • Operations that you expect to run longer than 12 hours require a service role. For more information, see Setting up Automation.	August 3, 2017
Configuration Compliance	Use Amazon EC2 Systems Manager Configuration Compliance to scan your fleet of managed instances for patch compliance and configuration inconsistencies. You can collect and aggregate data from multiple AWS accounts and AWS Regions, and then drill down into specific resources that aren't compliant. For more information, see AWS Systems Manager Compliance.	August 8, 2017

Change	Description	Release date
SSM Document Enhancements	SSM Command and Policy documents now offer cross-platform support. This means that a single SSM document can process plugins for Windows and Linux operating systems. Cross-platform support allows you to consolidate the number of documents you manage. Cross-platform support is offered in SSM documents that use schema version 2.2 or later. SSM Command documents that use schema version 2.0 or later can now include multiple plugins of the same type. For example, you can create a Command document that calls the `aws:runRunShellScript` plugin multiple times. For more information about schema version 2.2 changes, see AWS Systems Manager documents. For more information about SSM plugins, see Command document plugin reference.	July 12, 2017

Change	Description	Release date
Linux Patching	Patch Manager can now patch the following Linux distributions: **64-bit and 32-bit systems** • Amazon Linux 2014.03, 2014.09, or later • Ubuntu Server 16.04 LTS, 14.04 LTS, or 12.04 LTS • Red Hat Enterprise Linux (RHEL) 6.5 or later **64-bit systems only** • Amazon Linux 2015.03, 2015.09, or later • Red Hat Enterprise Linux (RHEL) 7.x or later For more information, see AWS Systems Manager Patch Manager. **Note** • To patch Linux instances, your instances must be running SSM Agent version 2.0.834.0 or later. For information about updating the agent, see the section titled *Example: Update SSM Agent* in Running commands from the console. • The `AWS-ApplyPatchBaseline` SSM document is being replaced by the `AWS-RunPatchBaseline` document.	July 6, 2017

Change	Description	Release date
Resource data sync	You can use Systems Manager resource data sync to send Inventory data collected from all of your managed instances to a single Amazon S3 bucket. Resource data sync then automatically updates the centralized data when new Inventory data is collected. With all Inventory data stored in a target S3 bucket, you can use services like Amazon Athena and Amazon Quick Suite to query and analyze the aggregated data.For more information, see Creating a resource data sync for Inventory. For an example of how to work with resource data sync, see Walkthrough: Using resource data sync to aggregate inventory data.	June 29, 2017
Systems Manager Parameter Hierarchies	Managing dozens or hundreds of Systems Manager parameters as a flat list is time-consuming and prone to errors. You can use parameter hierarchies to help you organize and manage Systems Manager parameters. A hierarchy is a parameter name that includes a path that you define by using forward slashes. Here is an example that uses three hierarchy levels in the name to identify the following: /Environment/Type of computer/Application/Data `/Dev/DBServer/MySQL/db-string13` For more information, see Working with parameter hierarchies in Parameter Store.	June 22, 2017
SSM Agent Support for SUSE Linux Enterprise Server	You can install SSM Agent on 64-bit SUSE Linux Enterprise Server (SLES). For more information, see Working with SSM Agent on EC2 instances for Linux.	June 14, 2017

Document conventions

The following are common typographical conventions for the *AWS Systems Manager User Guide*.

Differentiated examples for local operating systems or command line languages

We use tabs to present different examples of commands based on a user's local operating system type. For Linux and macOS examples, we use the backslash (\ ) character to break long commands into multiple lines. For Windows Server examples, we use the caret (^) character to break commands into multiple lines.

Example:

Linux & macOS

```
aws ssm update-service-setting \
    --setting-id arn:aws:ssm:region:aws-account-id:servicesetting/ssm/managed-instance/activation-tier \
    --setting-value advanced
```

Windows

```
aws ssm update-service-setting ^
    --setting-id arn:aws:ssm:region:aws-account-id:servicesetting/ssm/managed-instance/activation-tier ^
    --setting-value advanced
```
